

Servo Drives and Motors

Technical Data

High performance AC brushless
servo motors and servo drives

Control Techniques™
Leroy-Somer™

Complete servo solutions for continuous and pulse duty applications

Control Techniques and Leroy-Somer offer a full range of servo drive and motor solutions that are tailored to work together to deliver maximum performance for both continuous and pulse duty servo applications.

Pulse duty

The Digitax ST servo drive and the Unimotor hd servo motor make up a complete servo solution for pulse duty applications where high peak torque is required.

Combining low torque with high current overload, the Digitax ST - Unimotor hd solution delivers high performance with superior motor control, reduced cabinet size through compact yet powerful design and flexibility via a range of options.

The pulse duty servo solution offers the highest performance for the most demanding applications such as flying shear, pick and place and industrial robotics.

Continuous duty

The Unidrive M700 servo drive and Unimotor fm servo motor solution is the ideal option for continuous duty applications where continuous torque is required.

The Unidrive M700-Unimotor fm solution brings optimized system performance through an onboard Advanced Motion Controller, maximized throughput with superior motor control, and ultimate flexibility through the option to add significant inertia to the motor.

The continuous duty servo solution delivers high performance for all continuous duty applications such as theatre hoists, printing machines and material handling.

As well as servo control, the Unidrive M700 offers class leading induction motor performance.

Wide range of complementary products

To complete the servo solution, Control Techniques and Leroy-Somer can supply a variety of geared Dynabloc servo motors and a wide range of optional drive modules, and additional equipment such as brakes, encoders and cables.

1 Introduction to Unimotor fm - continuous duty

1.1 Overview

Unimotor fm is a high performance brushless AC servo motor range designed for use in demanding continuous duty applications. The motors are available in six frame sizes with various mounting arrangements and motor lengths.

1.1.1 Reliability and innovation

Unimotor fm is designed using a proven development process that prioritises innovation and reliability. This process has resulted in a market leading reputation for both performance and quality.

1.1.2 Matched motor and drive combinations

Drives and motors from Control Techniques and Leroy-Somer are designed to function as an optimized system. Unimotor fm is the perfect partner for Unidrive M and Digitax ST.

1.1.3 Features

Unimotor fm is suitable for a wide range of industrial applications, due to its extensive range of features

- Torque range: from 1.4 Nm to 136 Nm
- High energy parking brakes
- Numerous connector variants, e.g. vertical, 90 ° low profile, 90 ° rotatable and hybrid box on frame size 250
- Variety of flange possibilities (IEC/NEMA)
- Various shaft diameters; keyed or plain
- IP65 conformance; sealed against water spray and dust when mounted and connected
- Low inertia for high dynamic performance; high inertia option available
- World class performance
- Supported by rigorous testing for performance and reliability
- Winding voltages for inverter supply of 400 V and 220 V
- Rated speeds from 1,000 to 6,000 rpm and others available
- Thermal protection by PTC thermistor/ optional KTY84.130 sensor
- 48 VDC voltage and lower speeds on request

1.1.4 Faster set-up, optimized performance

When a Control Techniques servo drive is connected to a Unimotor fm fitted with a SinCos or Absolute encoder, it can recognize and communicate with the motor to obtain the "electronic nameplate" data. This motor data can then be used to automatically optimize the drive settings. This feature simplifies

commissioning and maintenance, ensures consistent performance and saves time.

1.1.5 Accuracy and resolution to suit your application requirements

Choosing the right feedback device for your application is critical in getting optimum performance. Unimotor fm has a range of feedback options that offer different levels of accuracy and resolution to suit most applications:

- Resolver: robust for extreme applications and conditions
 - low accuracy, medium resolution
- Incremental encoder: high accuracy, medium resolution
- Inductive/capacitive SinCos/Absolute: medium accuracy, high resolution
- Optical/SinCos/Absolute: high accuracy, high resolution
- Single turn and multi-turn: Hiperface and EnDAT protocols supported

1.1.6 Ideal for retrofit

Unimotor fm is an ideal retrofit choice with features to ensure it can integrate easily with your existing servo motor applications. Unimotor fm has been designed so that existing Unimotor customers can easily migrate to the new platform. All connector interface types and mounting dimensions remain the same. If you are planning to retrofit your system, Unimotor fm is the obvious choice.

1.1.7 Custom built motors

As part of our commitment to you, we can design special products to meet your application specific requirements.

Custom built motors are identified by the code S*** added to the end of the part number and can include custom shafts, connections or coatings.

e.g. SPZ – Motor is left unpainted
SON – Motor is fully painted.

(*Indicates additional letters)

1.1.8 Wide range of accessories

Unimotor fm has a wide range of accessories to meet all your system requirements:

- Feedback and power cables for static and dynamic applications
- Fan boxes
- Gearboxes
- Cable connectors

1.1.9 Quick reference table

1.2 Unimotor fm ordering code information - D+10 lead time

Use the information below in the illustration to create an order code for a Unimotor fm.

095	U	3	B	30	5	B	
Frame size	Motor voltage	Magnet type	Stator length	Rated speed	Brake	Connection type	
075	075-142 Frame	075-142 Frame	075 Frame	075-142 Frame	075-142 Frame	Size 1	
095	U = 400V	3 = Standard	B/D	30 = 3000 rpm	0 = Not fitted	B = Power and signal 90° rotatable	
115			095 Frame		5 = Parking brake	C = Power 90° rotatable and signal vertical	
142			B/C/D			V = Power and signal vertical	
			115 Frame			Size 1.5	
			B/C/D			J = Power and signal 90° rotatable	
			142 Frame			N = Power 90° rotatable and signal vertical	
			C/D/E			M = Power and signal vertical	

Express availability motors,
available in ten days ex works

Unimotor fm ordering code information - Standard lead time

Additional options are available upon request but may require a longer lead time to complete, please check with the Industrial Automation Center.

095	U	3	A	30	5	B	
Frame size	Motor voltage	Magnet type	Stator length	Rated speed	Brake	Connection type**	
075	075-190 Frame	075-250 Frame	075	075-190 Frame	075-250	Size 1	
095	E = 220V	3 = Standard	A/B/C/D	20 = 2000 rpm	0 = No brake	B = Power and signal 90° rotatable	
115	U = 400V		095 -142	40 = 4000 rpm	5 = Parking brake	C = Power 90° rotatable and signal vertical	
142	250 Frame		A/B/C/D/E	60 = 6000 rpm*	X = Special	V = Power and signal vertical	
190	U = 400V		190	250 Frame		D = Single cable, power & signal combined, 90° rotatable	
250			A/B/C/D/E/F/G/H	10 = 1000 rpm		Size 1.5	
			250*	15 = 1500 rpm		J = Power and signal 90° rotatable	
			D/E/F	20 = 2000 rpm *		N = Power 90° rotatable and signal vertical	
				25 = 2500 rpm *		M = Power and signal vertical	
						E = Single cable, power & signal combined, 90° rotatable	
						Hybrid box	
						H = Power hybrid box	
						X = Special	

* 6000rpm only available on certain lengths:

* 250 D and E lengths, winding speed equal and above 2500rpm must use the hybrid box.

* 250 F lengths, winding speed equal and above 2000rpm must use the hybrid box.

- 190 – Lifting eyes will be fitted as standard on all 190 motors. This is to enable easy handling of these motors that are often over 25 kg in weight. If there is an issue with the lifting eyes causing an obstruction when fitting the mating cable then the lifting eyes maybe removed once the motor is installed in the application.

- Hybrid Box Connection – Due to the increased power rating of some of the 190 motors a hybrid box is now being offered. A motor fitted with the Hybrid box will not be UL marked. If a specific motor from the fm range that now has a Hybrid box has previously been purchased with a connector and is working within an application please contact Control Techniques Dynamics to discuss the options available.

- Single cable only available with certain feedback options. Please check before ordering.

** Not all options are available on all frames sizes please check before ordering

- Shaft sizing - Please ensure that the correct shaft size is selected to meet the application requirement.
- 142 Connector Rating - Due to the increased power rating of some of the 142 motors a type "J" or "M" Size 1.5 power connector is now being offered. If a specific motor from the fm range that now has a "J" or "M" type connector has previously been purchased with a "B" or "C" or "V" size 1 connector and is working within an application please contact Control Techniques Dynamics to discuss the options available.
- Sensorless mode - Motor performance will be limited at low speed, please read Feedback Terminology section for details.

The recommended connector has been selected using the connector manufacturer's de-rating values applied to a motor at full operating temperature.

The Unimotor fm 250 servo motor has been designed to give greatest motor efficiency up to a rated, or rms, speed of 1,500 rpm. The range does include the optional speeds of 2,000 rpm and 2,500 rpm. These windings will allow the end user to enter the intermittent speed zone as well as the intermittent torque zone on the 250 motor.

These higher speed windings are designed with optimum kt values that allow increased speed without demanding very high currents.

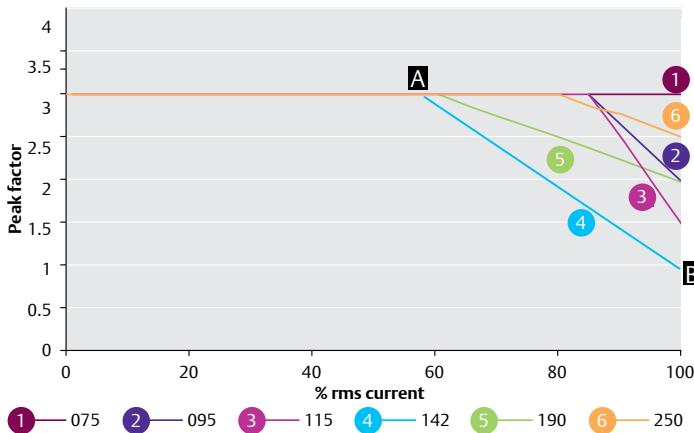

The Unimotor fm 250 is designed for S2 to S6 duties and as such the rms values play an important part in the motor selection for torque and speed.

1.4 Peak torque information

On some of the frame sizes the full peak torque cannot be achieved at the full 100 % rms current level. As shown below the 075 motors is not affected by the reduced levels and remains constant up to 100 % rms current, whereas the 250 motors all show a drop at some point along the % rms current line.

The graph below shows the standard peak factor for each frame size.

Standard peak torque factor

To use this graph correctly the rms current and rms speed of the application have to be calculated. The rms current value must then be converted into a percentage of the full motor current available at that rms speed value. If the full current available is 10 Amps and the rms current is 7.5 Amps, then the percentage rms current value is 75 %. This value can then be plotted onto the graph in order to obtain the peak factor. The peak factor is then used as part of the calculation, shown below, for the peak torque value.

$$\text{Peak factor} \times \text{Stall current} \times kt = \text{Peak torque}$$

An example would be with a 142U3E300 motor where the % rms current value is calculated to 50 %, the peak factor would be 3 (point A).

$$\text{Peak factor} \times \text{Stall current} \times kt = \text{Peak torque}$$

$$3.00 \times 15.6 \times 1.6 = 74.9 \text{ Nm}$$

But if the % rms current value were to be calculated at a level of 100 %, the peak factor would equal 1.00 (point B).

$$\text{Peak factor} \times \text{Stall current} \times kt = \text{Peak torque}$$

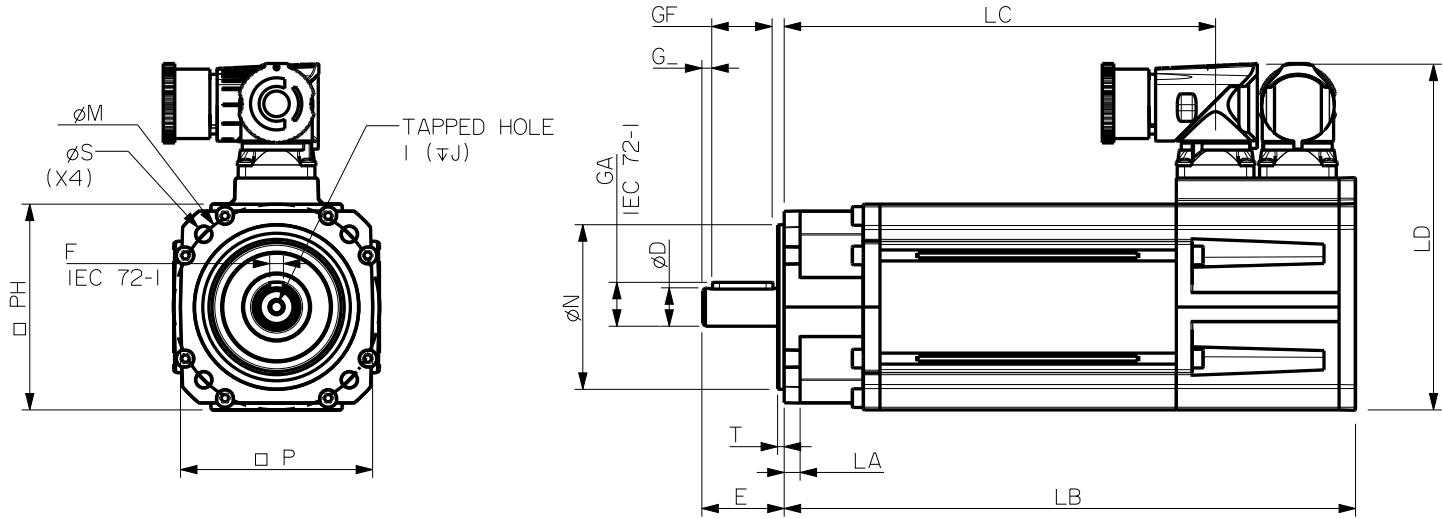

$$1.00 \times 15.6 \times 1.6 = 25 \text{ Nm}$$

Peak torque is defined for a maximum period of 250 ms, rms 3,000 rpm $\Delta_{\max} = 100^\circ\text{C}$, 40 °C ambient.

Unimotor fm	Peak factor 0 % to 100 % rms	
075	3.0	
095	Peak factor 0 % to 88 % rms 3.0	Peak factor @ 100 % rms 2.0
115	Peak factor 0 % to 86 % rms 3.0	Peak factor @ 100 % rms 1.5
142	Peak factor 0 % to 57 % rms 3.0	Peak factor @ 100 % rms 1.0
190	Peak factor 0 % to 60 % rms 3.0	Peak factor @ 100 % rms 2.0
250	Peak factor 0 % to 80 % rms 3.0	Peak factor @ 100 % rms 2.5

Case Study 1 - Servo technology improves reliability and accuracy of new packaging machine

CMC Machines designs and manufactures advanced systems for the paper and film wrapping industry.

The Challenge

CMC needed an advanced servo system for a new design of packaging machine: Cartonwrap. Cartonwrap machines use a cardboard roll to make boxes of virtually any size, adapting the container to the size of the item. Products are fed into the machine on a conveyor and the box is formed around them. This eliminates the need to stock pre-formed boxes and leads to a drastic reduction of filling materials inside boxes.

The Solution

CMC chose a servo drive solution from Control Techniques and Leroy-Somer: each Cartonwrap machine uses 22 Digitax ST servo drives and Unimotor fm servo motors. Digitax ST drives use multi-network management via a central PC and Ethernet for coordinating all production menus and motion parametric equations on the individual process components. CMC machinery uses SM Applications Plus modules in each drive - providing automation controllers with integrated fieldbus communications and I/O.

The Benefits

- Control Techniques and Leroy-Somer engineers developed bespoke software for CMC's machines
- SM-Applications plus modules eliminate need for external PLC, resulting in increased communication speed due to reduced wiring

2 Introduction to Unimotor hd - pulse duty

2.1 Overview

Unimotor hd is a high dynamic brushless AC servo motor range designed for use in pulse duty applications where rapid acceleration and deceleration are required. The motors are available in six sizes from 055 to 190.

2.1.1 Reliability and innovation

Unimotor hd is designed using a proven development process that prioritizes innovation and reliability. This process has resulted in a market leading reputation for both performance and quality.

2.1.2 Matched motor and drive combinations

Drives and motors from Control Techniques and Leroy-Somer are designed to function as an optimized system. Unimotor hd is the perfect partner for Unidrive M and Digitax ST

2.1.3 Key features

Unimotor hd is suitable for a wide range of industrial applications, due to its extensive features.

- Torque range: 0.72 Nm to 85.0 Nm
- High torque to inertia ratio for high dynamic performance
- Compact but powerful
- High energy dissipation brakes
- IP65 conformance: sealed against water spray and dust when mounted and connected
- Segmented stator design
- World class performance
- Supported by rigorous testing for performance and reliability
- Winding voltages for inverter supply of 400 V and 220 V
- Rated speeds from 1,000 to 6,000 rpm
- Larger shafts to increase torsional rigidity
- Thermal protection by PTC thermistor/ optional KTY84.130 sensor

2.1.4 The ultimate motor and drive combinations

Control Techniques and Leroy-Somer offer drive and motor combinations that provide an optimized system in terms of ratings, performance, cost and ease of use. Unimotor hd motors fitted with high resolution SinCos or Absolute encoders are pre-loaded with the motor "electronic nameplate" data during the manufacturing process. This data can be read by any of our servo drives and used to automatically optimize the drive settings. This feature simplifies commissioning and maintenance, ensures consistent performance and saves time.

2.1.5 Accuracy and resolution to suit your application requirements

Choosing the right feedback device for your application is critical in getting optimum performance. Unimotor hd has a range of feedback options that offer different levels of accuracy and resolution to suit most applications:

- Resolver: robust for extreme applications and conditions - low accuracy, medium resolution
- Incremental encoder: high accuracy, medium resolution
- Inductive/capacitive SinCos/Absolute: medium accuracy, high resolution
- Optical/SinCos/Absolute: high accuracy, high resolution
- Single turn and multi-turn: Hiperface and EnDAT protocols supported

2.1.6 Custom built motors

As part of our commitment to you, we can design special products to meet your application specific requirements.

2.1.7 Quick reference table

3 Generic information

3.1 Performance definitions

Stall torque	This is the maximum torque within the continuous zone at zero speed. Maximum continuous torque ratings may be intermittently exceeded for short periods provided that the winding Δt max temperature is not exceeded. Δt max = 100 °C over a maximum ambient of 40 °C for Unimotor fm and Unimotor hd.	Winding thermal time constant The thermal time constant of the winding with respect to the stator temperature as a reference in the exponential temperature rise given by the formula: Winding temperature at time t seconds = $T_0 + T_1(1 - e^{-t/t_c})$ Where T_0 is the initial temperature, T_1 is the final winding temperature and t_c = thermal time constant (seconds) Note that temperature = 63.2 % of T_1 when $t=t_c$ A thermal protection trip is provided by the drive, based upon calculations using elapsed time, current measurement, and the parameter settings set by the user or directly from the motor map. Unimotor fm and Unimotor hd windings are ultimately protected by thermistor devices in the winding overhangs. These must be connected to the appropriate drive inputs via the motor feedback signal connector.
Stall current	Stall current = Stall torque / k_t Motor label and performance tables quote stall current when motor is at full power in a maximum ambient of 40 °C.	
Rated speed	This is the maximum speed of the motor within the continuous zone. The motor speed can be controlled to any speed subject to the voltage limits and drive constraints as shown by the intermittent zone on the graph (see performance graphs - section 4).	
Ke voltage constant	This is the phase to phase rms voltage generated at the stator when the shaft is back driven at 1,000 rpm with the rotor at 20 °C.	Rated power This is the product of the rated speed (radian/sec) and the rated torque (Nm) expressed in Watts (W).
Kt torque constant	A brushless motor delivers torque proportional to the current, such that torque = $K_t \times$ current. Where $K_t = 0.0165 \times K_e$ (at 20 °C). Magnets used on all motors are affected by temperature such that K_e and K_t reduce with increasing temperatures of the magnets. The reductions depend upon the magnet type and material grade used.	Δt temperature Δt temperature is the temperature difference between the copper wires of the motor winding and the ambient air temperature surrounding the motor. The maximum Δt temperature permitted is 100 °C over a maximum ambient of 40 °C. (i.e. a maximum winding temperature of 140 °C)

3.2 Motor derating

Motor derating

Any adverse operating conditions require that the motor performance be derated. These conditions include: ambient temperature above 40 °C, motor mounting position, drive switching frequency or the drive being oversized for the motor.

Ambient temperature

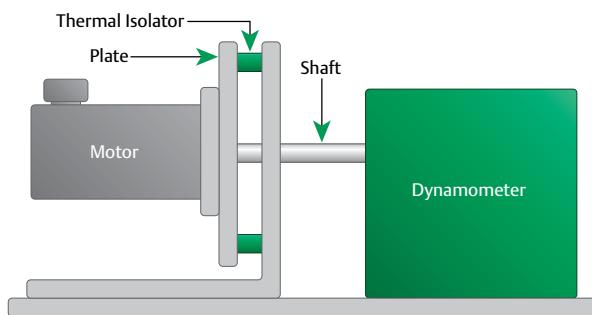

The ambient temperature around the motor must be taken into account. For ambient temperatures above 40 °C the torque must be derated using the following formula as a guideline. (Note: Only applies to 2,000/3,000 rpm motors and assumes copper losses dominate.)

$$\text{New derated torque} = \text{Specified torque} \times \sqrt{1 - ((\text{Ambient temperature} - 40^\circ\text{C}) / 100)}$$

For example with an ambient temperature of 76 °C the new derated torque will be 0.8 x specified torque.

Thermal test conditions

The performance data shown has been recorded under the following conditions. Ambient temperature 20 °C, with the motor mounted on a thermally isolated aluminum plate as shown below.

Motor type/frame	Aluminium heatsink plate
055 mm	110 x 110 x 27 mm
067-089 mm	250 x 250 x 15 mm
115-142 mm	350 x 350 x 20 mm
190 mm	500 x 500 x 20 mm

Mounting arrangements

The motor torque must be derated if:

- The motor mounting surface is heated from an external source, such as a gearbox.
- The motor is connected to a poor thermal conductor.
- The motor is in a confined space with restricted air flow.

Drive switching frequency

Most Unidrive M and Digitax ST nominal current ratings are reduced for the higher switching frequencies. See the appropriate drive manual for details.

See the table below for the motor derate factors. These figures are for guidance only.

3.2.1 Unimotor fm derate factors

Switching frequency	Derate factors by frame size and switching frequency									
	075		095		115		142		190	250
	A-D	A-E	A-C	D-E	A-C	D-E	A-B	C-H	D-F	
3 kHz	0.93	0.88	0.89	0.84	0.87	0.81	0.98	N/A	0.88	
4 kHz	0.94	0.91	0.91	0.87	0.91	0.86	0.99	0.55	0.90	
6 kHz	0.95	0.93	0.93	0.90	0.94	0.89	0.99	0.77	0.94	
8 kHz	0.98	0.97	0.97	0.95	0.97	0.96	1	0.90	0.98	
12/16 kHz	1	1	1	1	1	1	1	1	1	

Note

Only applies to motors up to 3,000 rpm (rms) or lower. Assumes copper losses dominate on all frame sizes. Derate factor is applied to stall torque, rated torque, stall current and rated power.

3.2.2 Unimotor hd derate factors

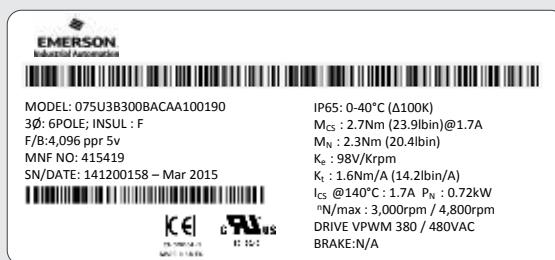

Switching frequency	Motor type/frame						
	055	067	089	115	142	190	
3 kHz	0.92	0.93	0.89	0.89	0.83	0.90	
4 kHz	0.93	0.94	0.91	0.92	0.85	0.95	
6 kHz	0.95	0.95	0.95	0.96	0.88	1	
8 kHz	0.96	0.98	0.97	0.98	0.91	1	
12/16 kHz	1	1	1	1	1	1	

Note

Only applies to motors up to 3,000 rpm (rms) or lower. Assumes copper losses dominate on all frame sizes. Derate factor is applied to stall torque, rated torque, stall current and rated power.

3.3 Nameplate

3.3.1 Unimotor fm/hd

Model	This is the full part number of the motor	M_N	The rated torque of the motor
3Ø	Indicates this motor is a 3 phase motor	K_e	This is the AC Volts per 1,000 rpm with the motor at 20 °C
POLES	Number of poles: → 055-8 poles - 4 pole pairs (hd only) → 067-190 - 10 poles - 5 pole pairs (hd only) → 075-142 - 6 poles - 3 pole pairs (fm only) → 190-8 pole - 4 pole pairs (fm only) → 250-10 poles - 5 pole pairs (fm only)	K_t	Value shown is for the magnet's temperature at 20 °C
Insul	Windings are built to class F (155 °C)	I_{cs}	The constant stall current at the maximum winding temperature of 140 °C
F/B	This gives the feedback device, count and working voltage or the feedback type	P_N	The rated power of the motor
MNF NO	This is the work order for the motor	"N/max	The rated speed/ this is the maximum speed allowed when taking into account these three factors: 1) Maximum drive voltage 2) Maximum encoder speed 3) Maximum mechanical speed
S/N DATE	The serial number and date the motor was manufactured	Drive	This indicates that the motor is for use with a voltage pulse width modulated drive with the supply voltage shown
IP	Ingress protection rating IP 65S	VPWM	
M_{cs}	The stall torque at stall current	Brake	The current, that rated torque and the operation voltage for the brake or N/A if the brake is not fitted

3.4 Motor selection

A reliable servo system depends upon the initial system design and correct selection of the motor, feedback, gearbox and drive. To ensure success careful attention should be paid to the following points:

- Speed, acceleration and inertia
- Peak and rms torque
- Motor feedback type
- Gear ratios
- Drive system operational mode
- Thermal effects
- Environmental conditions
- Mechanical restrictions
- Cost of motor-drive combination

It is necessary to estimate the root mean square (rms) torque value of the load. Where the motor has varying duty cycles it may be necessary to consider the worst case only.

Never exceed the maximum peak torque ratings.

Calculate the rms load torque at the motor and ensure that this is less than the motor rated torque. An additional allowance should be made on the load for inefficiencies and tolerance.

Choose a suitable motor within the size limitations of the installation. The frame size and motor speed may be selected using the performance data. Look for the rated torque at the appropriate temperature.

3.5 Checklist of operating details

Complete this checklist to help select which Unimotor fm best suits your application requirements.

Torque speed

- What motor operating speed do you require (rpm)?
 - 500
 - 1,000
 - 2,000
 - 3,000
 - 4,000
 - 6,000
 - Other (non standard speed)
- What is the rms torque?
Decide on switching frequencies for the drive, and derate motor or drive accordingly
- If the ambient temperature is above 40 °C, apply a derating factor. If the motor is mounted to a hot interface; or interfaced with a low thermal mass; or high thermal resistance; apply a derating factor. Torque ratings of motors are stated in controlled conditions mounted on a reference front plate. Details can be found in the *Performance data* selection
- Inertia mismatch (ratio of the motor inertia to load inertia reflected to motor shaft) can be as high as 3:1 for acceleration rates of 1,000 rad/s² for a typical system. Larger mismatches or acceleration can be tolerated with a rigid mechanical system and high resolution feedback
- Do you require a brake?

Motor mounting

- Does the motor fit the machine?
Make allowances for cables and connections.
- Do you require an output key?
 - Output key
 - Plain shaft

Feedback

- Do you want an encoder or resolver?
 - Incremental
 - SinCos Multi turn
 - SICK Hiperface
 - Heidenhain EnDat
 - Inductive absolute
 - High accuracy
 - SinCos single turn
 - SICK Hiperface
 - Heidenhain EnDat
 - Inductive
 - High accuracy
 - Resolver

Electrical connections

- Connectors
 - Power and signal 90 ° rotatable
 - Power 90 ° rotatable and signal vertical
 - Power and signal vertical

Other options

- Do you require a gearbox?
 - Yes see Dynobloc fm/hd catalogue
 - No
- For further details on customer special motors, contact us.

3.6 Other points to consider

Torque and temperature

- The maximum allowable temperature of the motor windings or feedback device should not be exceeded. The windings have a thermal time constant ranging from 90 seconds to over an hour. Dependent upon motor temperature the motor can be overdriven for shorter periods without exceeding the temperature limitations. The motor winding thermal time constant should be set-up in the drive; this parameter is used for thermal shock (P^2t) calculations within the drive
- The motor winding thermal time constant should be large in comparison with the medium term periods of high rms torque
- Ensure that the drive's features, such as switching frequency, waveforms, peak and continuous currents are suitable for the application. Low switching frequencies of the drive will require motor derating
- Torque estimates should include friction and acceleration (and hence inertia) calculations
- Consider the motor cooling effects; for example, is the conductive thermal path adequate? Is the motor mounted on a gearbox or heat source?
- Ensure that the motor and drive can meet the short term peak torque requirements

Braking

- The installation may require static parking brake

Inertia

- Ensure that the motor has correct inertia matching to suit the acceleration requirements. Consider inertia load matching especially for acceleration levels above 1,000 rad/s². Motors with larger frame diameters have higher inertia. Higher inertia rotor options are available

Environmental conditions

- Other environmental factors, such as vibration, pressure, shock, heat and hazardous zones should be considered

Cables

- The cable lengths required for the installation should be considered. For maximum cable length, see *Maximum cable length* in the *Cable* section. Compliance with both Safety and EMC regulations should be ensured
- Ensure motor is mounted firmly and properly earthed. Screen all cables to reduce system noise and EMC

Feedback

- To achieve an efficient system it is necessary to ensure stiff mechanical connections and couplings to all rotating parts, so that a high servo bandwidth can be achieved. This will improve stability and enable higher servo gains to be set, ensuring higher accuracy and positional repeatability
- High resolution feedbacks will increase stability and allow greater acceleration or inertia mismatch

Bearing loads

- Check the radial and axial loadings are within the limits of the motor

3.7 Special motor requests

Leroy-Somer offer many 'special' motors. These motors are designed to meet a specific customer's requirements.

Special motors are denoted by a code on the end of the part number. S*** 3 or 4 digits; e.g. 115U3E100BACAA115240-SON (special coating)

To request a special motor please contact Leroy-Somer with the customer requirements. A product enquiry form will be raised and R&D/Engineering will investigate the feasibility of the request. If acceptable then a special part number reference will be allocated to the motor and a quote will be issued.

Once an order is placed a Product Approval Schedule (PAS) form will be raised and sent to the Automation Center for approval.

Special motors can include:

- Special paint finishes or unpainted motors
- Special motors with customer specific connector wiring
- Special motors with customer specific brakes
- Special motors with customer specific shaft dimension
- Special motors for harsh environments motors

3.8 Calculating load torque

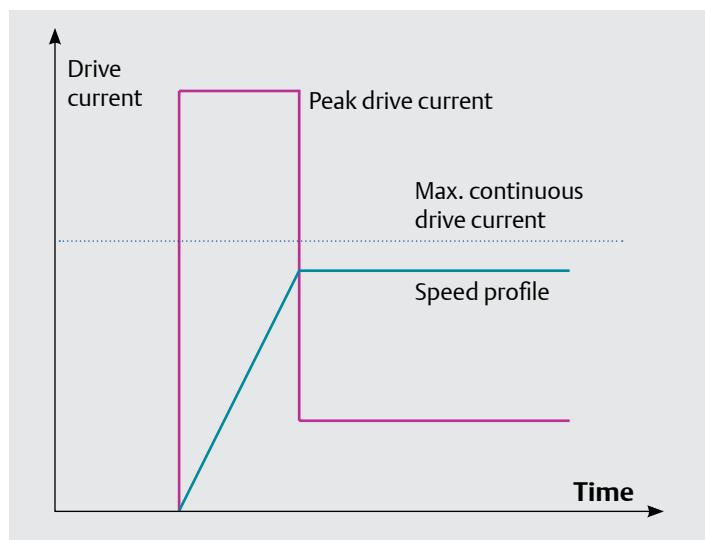

In any application, the load consists of various torque loads plus acceleration and deceleration of inertia.

Constant torque periods

Periods where a torque is maintained at constant or near constant motor speeds.

Acceleration and deceleration

Torque is required to achieve acceleration and deceleration. Acceleration times of less than one second can often be achieved using peak torque capability of the drive and motor.

Note

Peak drive current may be set by drive control to the motor's continuous current rating. If this is required, check that it is within the drive's capability. Medium periods of up to 200 % over current are often acceptable for the motor, provided that the heating effects are not too rapid and that the motor thermal time constant is long in comparison.

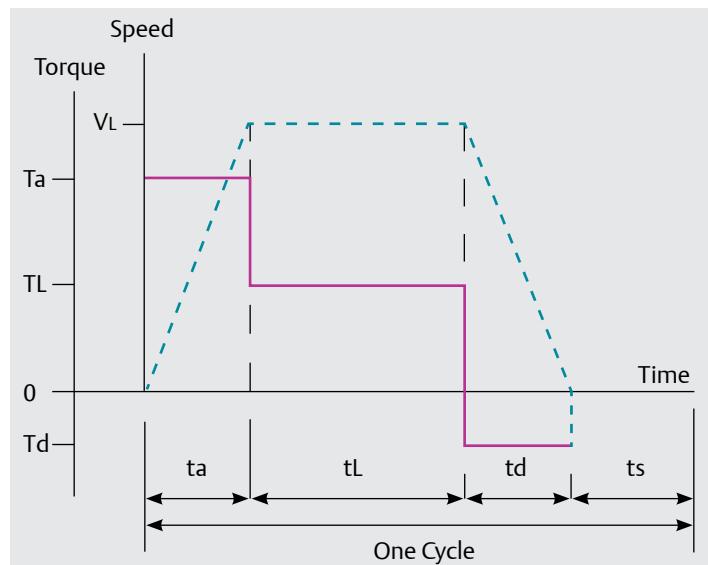

Inertia formula and accelerating or decelerating torques:

Inertial loads on a common shaft may be added together. Inertial loads may be reflected from the output of a reduction gearbox to the motor by dividing the output ratio by the square of the ratio.

$$\text{Total inertia} = \text{reflected inertial load at motor} + \text{motor inertia}$$

rms torque for a repetitive duty cycle:

Draw a graph of torque (T) against time for one complete repetitive cycle of events (or choose the worst case of various events). Make the torque axis vertical. On the same graph, draw the speed profile against time for one cycle.

From the above speed-torque diagram calculate the rms torque using the formula:

$$Trms = \sqrt{\frac{Ta^2 \times ta + TL^2 \times tL + Td^2 \times td + Ts^2 \times ts}{ta + tL + td + ts}}$$

Where:

Ta = Acceleration torque (Nm)

tL = On load running time (s)

TL = Load torque (Nm)

td = Deceleration time (s)

Td = Deceleration torque (Nm)

ts = Dwell time (s)

ta = Acceleration time (s)

VL = Full load speed (rpm)

Ts = Dwell torque (Nm=0)

Example

In an application where the torque speed profile is as above with **Ta** = 20 Nm, **TL** = 5 Nm, **Td** = -10 Nm, **ta** = 20 ms, **tL** = 5 s, **td** = 30 ms, **ts** = 3 s, **VL** = 3,000 rpm, **Ts** = 0 calculate the rms torque for this application.

$$Trms = \sqrt{\frac{20^2 \times 0.02 + 5^2 \times 5 + 10^2 \times 0.03 \times 3}{0.02 + 5 + 0.03 + 3}}$$

$$Trms = \sqrt{\frac{136}{8.05}}$$

$$Trms = 4.11 \text{ Nm}$$

15 % tolerance required hence the rms torque for this application = **4.73 Nm**

3.9 Understanding motor heating effects

During operation, the motor is subjected to heating effects from several sources. Some of these are obvious; others obscure. Whilst the motor specification allows for most of these heating effects, others depend on the application. This section examines some of the causes of motor heating.

Motor copper losses

Motor copper loss is a product of the rms current squared and the resistance of the motor windings. It includes ripple currents, determined by the switching frequency of the drive and the inductance of the motor. The inductance of the winding is generally low, so that the maximum drive frequencies should be selected commensurate with drive heating losses. Data in this manual is for switching frequencies as stated in the performance data section. If lower frequencies are used, motor performance is reduced.

Motor copper loss also includes losses arising from waveform distortions of either the drive or motor or both. The motor's back EMF waveform is sinusoidal and of low harmonic distortion. If lower frequencies are used, the drive current has higher distortion and hence the motor performance is reduced.

Motor current depends on the torque demanded by the load at any instant. This is normally given by the motor torque constant (K_t) in Nm/A. Although regarded as a constant, K_t decreases slightly when the motor is at maximum temperature.

The K_e for a brushless three phase motor is always quoted Volts(rms) per krpm, since the motor back emf is sinusoidal.

Motor iron losses

Motor iron loss is a heating effect produced in the motor laminations. It is caused by the rotating magnetic field cutting through the laminations, the higher the speed the higher the losses. For this reason the motor stall torque is greater than the motor rated torque at speed.

Iron loss depends on the strength of the magnetic field and type of laminations material.

Friction and windage

The bearings, oil seals and the air resistance to rotor speed cause internal friction. Its effect is relatively small and is included in the data provided.

Thermal protection

An incorrect system set up can give rise to excessive motor temperatures. This can be guarded against by the use of the motor thermistor protection facility.

Servo motor/drive system faults

Common but often unnoticed causes of motor overheating can be created by:

- Instability (self induced oscillation) within the overall servo feedback system
- Incorrect parameter settings in the drive protection system, for example peak current, and I^2t (thermal protection calculation for the drive)

The increase in resistance is measured by the drive and a "trip" will occur. Only once the motor has cooled can the trip be cleared.

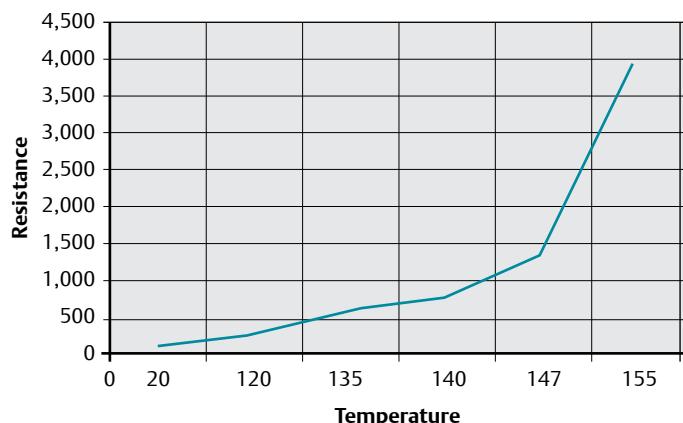

The installer must connect the motor thermistor to the drive to cause motor power shutdown in the event of overheating.

It is the installer's responsibility to ensure that this protection facility is properly connected and set at the drive.

Failure to ensure the correct operation of the protection facility invalidates the warranty in respect of a burnt out winding.

The ambient temperature of the environment into which the Unimotor is mounted must be considered.

Unimotor PTC 145 °C

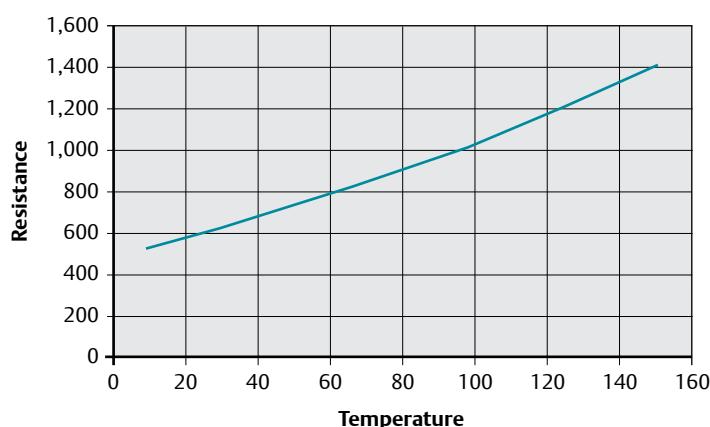

Thermistor protection

A PTC thermistor rated to 145 C, is built into the motor windings and is used to protect the motor against overheating problems.

The device remains a low resistance until a critical temperature is reached, where it will then switch to a very high resistance.

Unimotor KTY 84 -130 °C

KTY protection

A KTY 84-130 temperature sensor is built into the motor windings and is used to protect the motor against overheating problems. This device returns a resistance proportional to the winding temperature.

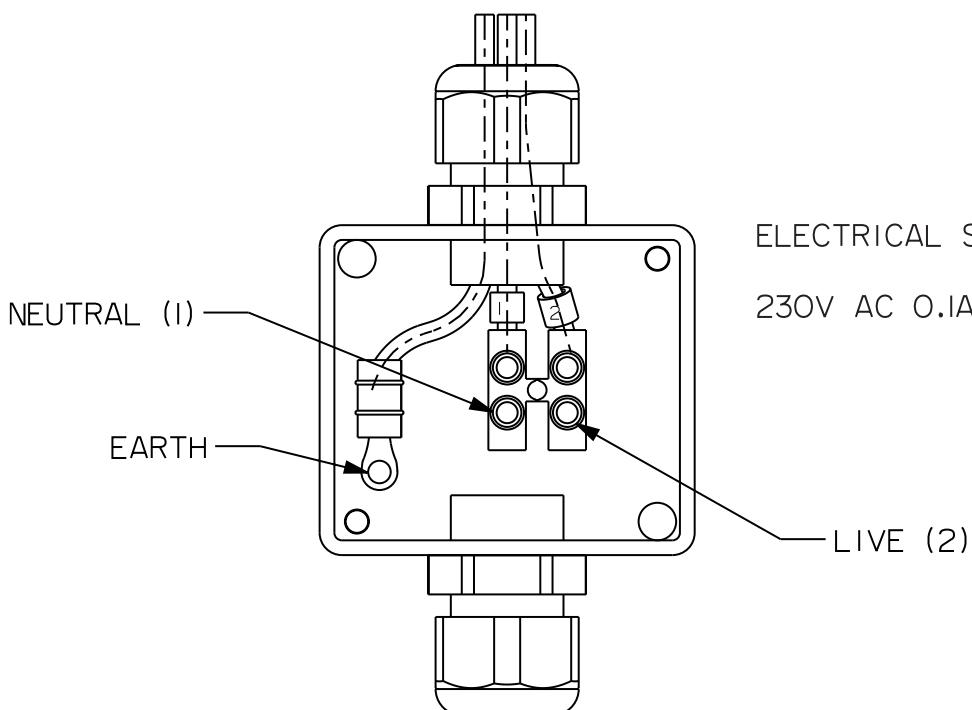

Fan boxes

The Unimotor fm and hd range can support a fan box unit, this can be retrofitted to the motor in the field and is used in applications where the motor's rated performance is not being exceeded and the fan box is used just to maintain a reduced motor temperature.

Fan Box units	Clearance distance behind fan box	Voltage	Free Air flow	Fan current rating
075 motor	40mm	230V AC	50 m ³ /h	0.05A
095 motor	40mm	230V AC	67 m ³ /h	0.05A
115 motor	40mm	230V AC	160 m ³ /h	0.08A
142 motor	50mm	230V AC	180 m ³ /h	0.07A
190 motor	60mm	230V AC	325 m ³ /h	0.13A

Fan box wiring

ELECTRICAL SPECIFICATION:

230V AC 0.1A

3.10 Feedback selection

Feedback device order code	Feedback type	Manufacturer	Encoder supply voltage	SinCos cycle or incremental pulses per revolution	Resolution available to position loop ^{2&3}	Absolute multi-turn revolutions	Feedback accuracy ¹	Single cable connector available ⁴	Serial communication protocol	Frame size compatibility

1 The information is supplied by the feedback device manufacturer and relates to it as a standalone device. The value may change when mounted into the motor and connected to a drive. These values have not been verified by Control Techniques and Leroy-Somer.

2 The output from the resolver is an analogue output; the resolution is determined by the analogue to digital converter used; the value shown is when the resolver is used in conjunction with the SM-Resolver.

3 The sin and cosine outputs from the SinCos optical encoders are analogue outputs; with Unidrive M and Digitax ST the resolutions quoted above are when the encoder type is set to either SC Endat or SC Hiperface depending on the encoder.

4 To be ordered with single cable connector, see connector options. 6 wire HMC6 must be ordered with KTY 84-130 thermistor, see inertia options.

3.11 Feedback terminology

Accuracy	Accuracy is the measure of the difference between the expected position and actual measured value. Rotary feedback accuracy is usually given as an angle representing the maximum deviation from the expected position. Linear feedback accuracy is usually given as a distance representing the maximum deviation from the expected. Generally, as accuracy increases the cost of the feedback device increases.	Commutation outputs Commutation outputs are used on devices that are non-absolute. For AC Synchronous 3 phase motors there are 3 commutation output signal channels from the feedback device, for example S1, S2 and S3. The diagram below shows commutation outputs for 6 pole commutation (3 pole pairs). The 3 phase motor sinusoidal power from the drive runs synchronously with motor speed at N/2 cycles per revolution;
Absolute encoder	Absolute encoders output unique information for each mechanical measured position. With the motor shaft or plate in any position when the drive is turned on the feedback device will always be able to sense a unique position and transmit this value to the drive. For an absolute single turn rotary encoder these unique positions will be over one revolution. When power is removed from the encoder and the shaft or plate moves the device will know its current position when the power is restored. A non-absolute feedback mechanism must start from a known position, such as the index or marker pulse.	
Bit	A bit is short for Binary Digit . It is the smallest unit of information in a machine/drive. A single bit has a binary value of either 0 or 1. These bits do not normally exist on their own, but usually in groups. The larger the number of bits in a group the larger the amount of information that is available and thus the higher the resolution. This group can be converted to decimal using binary arithmetic. The group of bits can be converted to decimal by starting at the right most bit and multiplying each successive bit to the left by two. So for example a 12 bit number would give a decimal equivalent of 4,096 and a 19 bit number would give a decimal equivalent of 524,288.	Where N = number of poles. For example, in a 6 pole motor, the encoder commutation tracks will output 3 pulses per channel per revolution and for an 8 pole motor the encoder commutation tracks will give 4 pulses per channel per revolution. The commutation signals allow the drive to operate the motor at 'switch on' with only a small possible reduction in efficiency and torque in the motor. The best way to explain this is to use an example where an encoder is connected to a motor with 6 poles. On power up the drive would look at the S1, S2 and S3 signals to determine where the stator is relative to the rotor or magnetic plate. This would give a known position that is within 60° electrical of an electrical cycle (20° mechanical). During this initial period, the drive assumes that it is in the middle of this 60° unknown region. So the worst case error of this is 30° electrical (10° mechanical), which equates to a drop of 13.4% in the rated torque when 100% current is delivered into the motor winding. When the drive is commanded to move the motor position, the stator is energized causing the plate or rotor to move. While the rotor or plate is moving, the drive detects that a signal switch (edge detection) has occurred on one of the commutation channels (S1, S2 or S3). At this point the drive knows exactly where it is in the electrical cycle and adjusts the field orientation to compensate for the error. At this point the drive switches over to using only the incremental signals for commutation and the commutation channels are no longer used.
Commutation	All brushless AC permanent magnet motors require commutation information to enable the drive to synchronize the stator flux field with the rotor of the motor. To ensure optimum torque at all rotor positions both when stationary and at speed the drive is required to maintain motor current in phase with the peak of the motor's sinusoidal waveform. The drive must therefore know the position of the rotor with respect to the stator at all times.	
Commutation phase offset	Most drives, including the Unidrive M and Digitax ST, provide a "Phase Offset" adjustment as a means of correctly setting the commutation position. For feedback devices that are not aligned, the Unidrive M has an Encoder Phasing Test (Autotune) (Pr 5.012) that automatically creates a Phase Offset value (Encoder phase angle) (Pr 3.025). All fm motor feedback devices are set to match the Unidrive M definition of zero phase offset, so that the drive may operate with zero phase offset adjustment, thus allowing interchange of motors between drives without further adjustment.	Electronic nameplate Available on some feedback devices the electronic nameplate provides the facility to electronically store information about the motor and feedback device. This information can then automatically be used to configure the drive for operation.

Note that not all drives have the same zero offset definition.

Feedback terminology

Environment	The environment is the external conditions that physically surround the Feedback device. The main factors that affect the feedback device are temperature and mechanical shock and vibration.	1) Optical An electronic device using an optical disc. An absolute encoder with high resolution that employs a combination of absolute information, transmitted via a serial link, and Sine/CoSine signals with incremental techniques.
	Motors are designed to allow the feedback devices to be within their operational temperature limits. Generally it is assumed that there is free air movement around the motor. If the motor is positioned where there is little or no airflow or it is connected to a heat source such as a gearbox, it can cause the air temperature around the feedback device to be operating outside its recommended operating temperature and can lead to problems.	2) Inductive/ Capacitive: An electronic device using inductively coupled PCBs. An absolute encoder with medium resolution that employs a combination of absolute information, transmitted via a serial link, and Sine/CoSine signals with incremental techniques. This encoder can be operated with the drive using either Sine/CoSine or absolute (serial) values only. Positional information is absolute within 4,096 turns - i.e. position is not lost when the drive is powered down.
	Mechanical shock and vibration tends to be transmitted from the load through the motor shaft and into the feedback device. This should be considered when the motor and feedback device are being specified for the application.	Multi-turn As previous but with extra gear wheels included so that the output is unique for each shaft position and the encoder has the additional ability to count complete turns of the motor shaft up to 4,096 revolutions.
Position	The defined position is the location in a coordinate system which is usually in two or more dimensions. For a rotary feedback device this is defined as the location within one revolution. If it is a multi-turn device it is the location within one revolution plus the location within a number of rotations. For a linear feedback device this is defined as the distance from a known point.	Sensorless Synchronous Rotor Flux Control. Recommended for use on the FM motor range. The motor performance will be limited when operating at low speed when using high frequency injection mode. When using closed loop vector mode the motor performance will be as stated in the rating tables.
Resolution	The resolution of a feedback device is the smallest change in position or angle that it can detect in the quantity that it is measuring. Feedback resolution of the system is a function of the type of feedback device used and drive receiving the information. Generally, as the resolution of the feedback device increases the level of control that can be used in the servo system increases. As with accuracy, as the resolution of the device increases the cost increases.	Serial Interface Serial communication is available on some feedback devices. It is the process of sending data one bit at a time, sequentially, over a communication channel. The specification normally used to define this method of communication is the EIA485 specification. These can be synchronous, which means that they operate with additional clock channels. The main advantage of synchronous data transmission is that it can operate at high speed. A disadvantage is that if the receiver goes out of synchronization it can take time for it to resynchronize and data may be lost. Note that not all serial interfaces use the clock channels. Serial interface communication allows data to be sent and received from the feedback device. In addition to the position and speed data other information can be sent such as multi-turn count, absolute position and diagnostic information.
Resolver	A passive wound device consisting of a stator and rotor elements excited from an external source, such as an SM-Resolver, the resolver produces two output signals that correspond to the Sine and CoSine angle of the motor shaft. This is a robust absolute device of low accuracy, capable of withstanding high temperature and high levels of vibration. Positional information is absolute within one turn - i.e. position is not lost when the drive is powered down.	Single cable connectors Some encoders can be used with single cable connectors. For benefits and integration details please refer to encoder manufacturer's documentation. These encoders transmit all feedback information including motor thermistor values using serial data. For this reason 6 wire HMC6 encoders fitted with a single cable connector need to be fitted with a KTY thermistor. Please refer to connector and inertia options in the ordering code information.
Incremental encoder	An electronic device using an optical disc. The position is determined by counting steps or pulses. Two sequences of pulses in quadrature are used so the direction sensing may be determined and 4 x (pulses per rev) may be used for resolution in the drive. A marker pulse occurs once per revolution and is used to zero the position count. The encoder also provides commutation signals, which are required to determine the absolute position during the motor phasing test. This device is available in 4,096, 2,048 and 1,024 ppr versions. Positional information is non absolute - i.e. position is lost when the drive is powered down.	Synchronous If something is synchronous it means that events are coordinated in time. For serial interfaces this means that clock channels are used.
SinCos/ Absolute Encoders	Types available are: Optical or Inductive - which can be single or multi-turn.	Asynchronous If something is asynchronous it means that events are not coordinated in time. For serial interfaces this means that clock channels are not used.
		Speed Speed is the rate of change in position which can be either angular or linear traveled per unit of time. For rotational motors this is usually defined as revolutions per minute (rpm).
		Volatile Stored information will be lost when power is removed.
		Non volatile Stored information will not be lost when power is removed.

3.12 Brake specification

Unimotor fm and hd may be ordered with an internal rear mounted spring applied parking brake. The brake works on a fail safe principle: the brake is active when the supply voltage is switched off and the brake is released when the supply voltage is switched on.

The standard parking brake is noted by the 5 code in the part number.

If a motor is fitted with a fail safe brake, take care not to expose the motor shaft to excessive torsional shocks or resonances when the brake is engaged or disengaged. Doing so can damage the brake.

Note.

Shunting the brake primary coil with an external diode to avoid switching peaks increases the release time considerably. This is usually required to protect solid state switches, or to reduce arcing at the brake relay contacts (Diode 1N4001 recommended)

SAFETY NOTE

The Fail-Safe Brake is for use as a holding brake with the motor shaft stationary.

Do NOT use it as a dynamic brake. Using it in this manner will cause brake wear and eventual failure. Emergency stop situations can contribute to brake wear and failure.

*Note 1 kg.cm² = 1x10-4 kg.m² ** Backlash figure will increase with time

- The brake is intended for parking duty and is not for dynamic or safety use
- Refer to your Automation Center or Distributor if your application requires dynamic braking in emergency conditions
- To provide protection to the brake control circuit it is recommended that a diode is connected across the output terminals of the solid state or relay contacts devices
- Larger torque brakes are available as an option. Contact your Automation Center or Distributor for details
- Figures are shown at 20 °C brake temperature. Apply the derate factor of 0.7 to the standard brake torque figures if motor temperature is above 100 °C. A derate factor of 0.9 applies to the high energy brake if motor temperature is above 100 °C
- The brake will engage when power is removed

It is recommended to run extensive application validation testing and confirm the motor brake life span when the motor is mounted vertically and the motor runs through high acceleration and deceleration.

3.13 Radial load

When selecting a motor some consideration must be made to the loading that the required application will put on the motor shaft. All shaft loads are transferred to the motor's bearing system, so a poorly selected motor could result in premature bearing failure.

Maximum axial and radial load

The following graphs show the Unimotor in terms of bearing strength. It has to be noted that the graphs are based on theoretical calculation, and that the bearing life of the motor is affected by the following:

- Speed
- Radial load applied to the bearings
- Axial load applied to the bearings
- Shock and vibration
(external shock/vibration applied to the motor)
- Bearing temperature
- Bearing cleanliness
- Motor mounting to the application

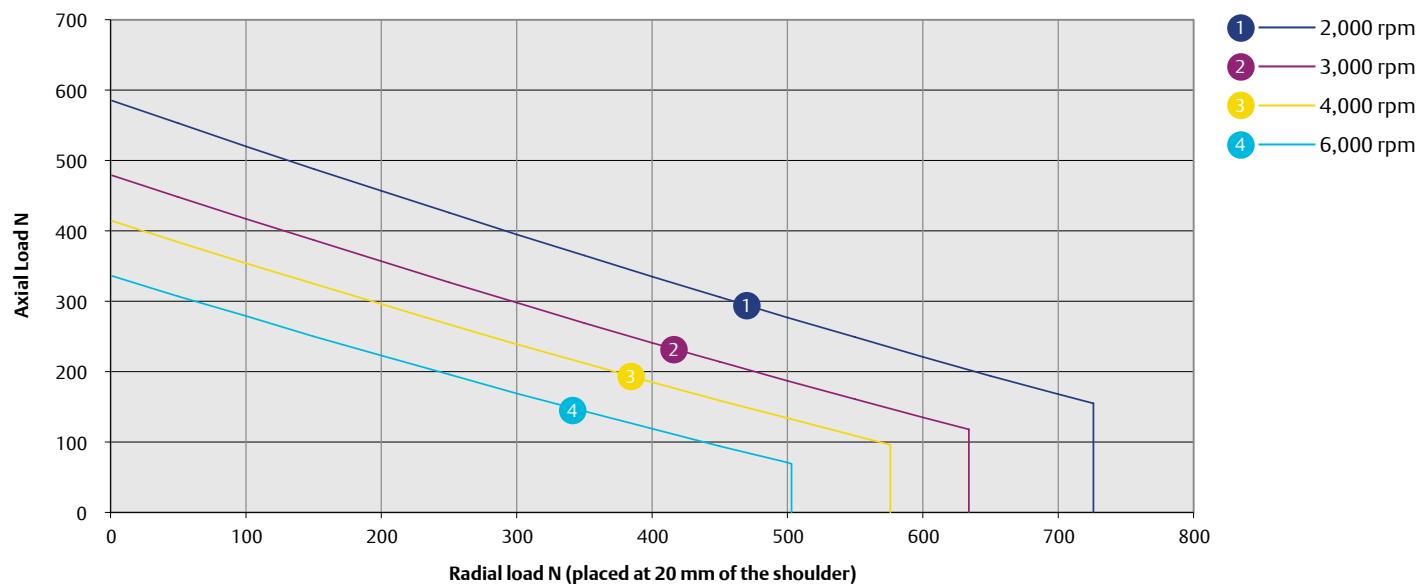

The loads in the following graphs have been calculated using ISO 281 calculation L10(h). The loads and speeds used are considered to be constant throughout the life of the bearing.

The following factors have been taken into consideration when calculating the loads:

- 90 % reliability
- Radial load applied on the output shaft away from the shoulder and constant. The distance can be read on the different graphs
- Axial load going toward the motor and constant
- Load factor of 1: no vibration applied to the motor
- Temperature of the bearing: 100 °C max
- Grease clean

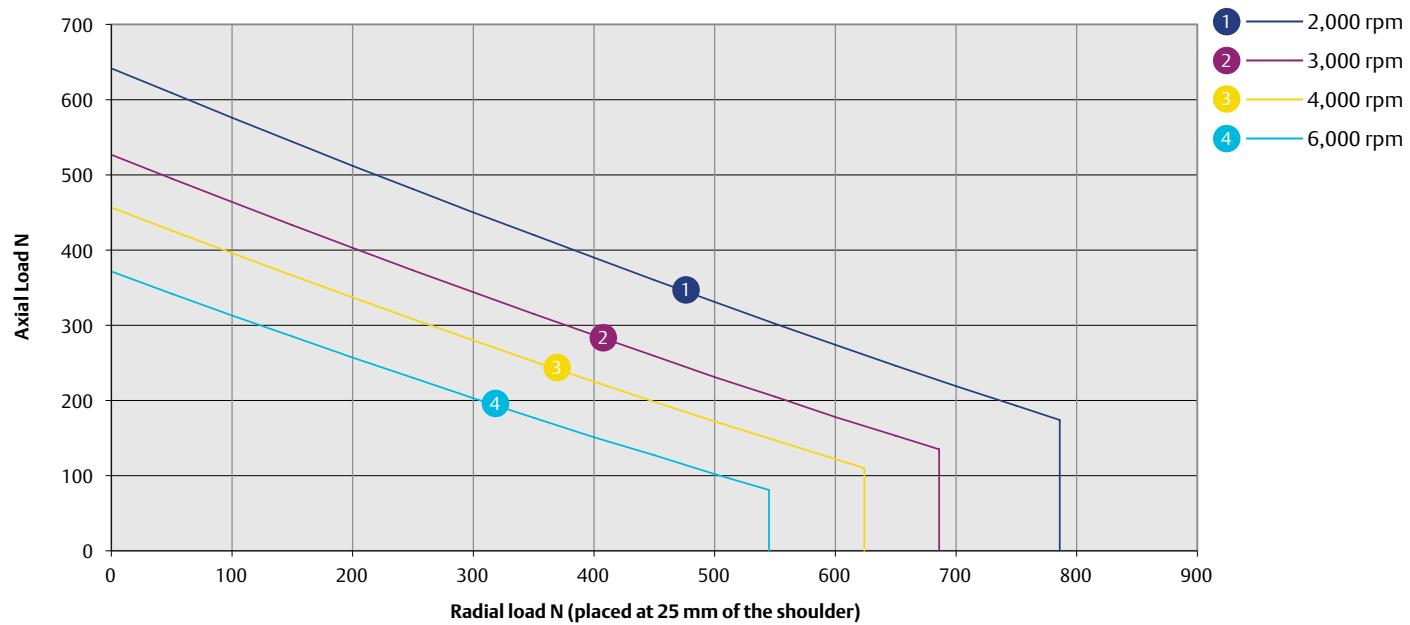

3.13.1 Radial load Unimotor fm

Radial load vs. axial load on 75U3/E3

75U3/E3 L_{10(h)} Bearing life for 20,000 hours (reliability 90 %, load factor of 1). Do not exceed a maximum axial load of 900 N
Axial loads exceeding that shown on the graph are permissible but the bearing life will be reduced below 20,000 hrs if applied

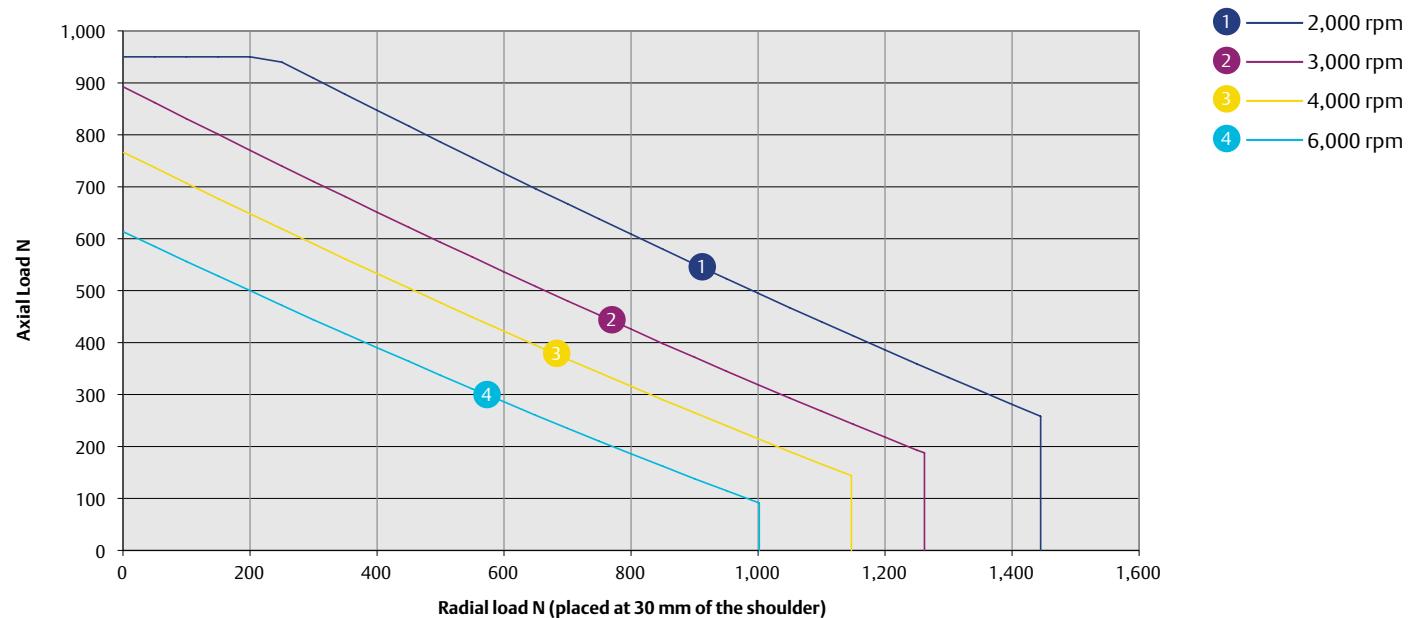

Radial load vs. axial load on 95U3/E3

95U3/E3 L_{10(h)} Bearing life for 20,000 hours (reliability 90 %, load factor of 1). Do not exceed a maximum axial load of 850 N

Axial loads exceeding that shown on the graph are permissible but the bearing life will be reduced below 20,000 hrs if applied

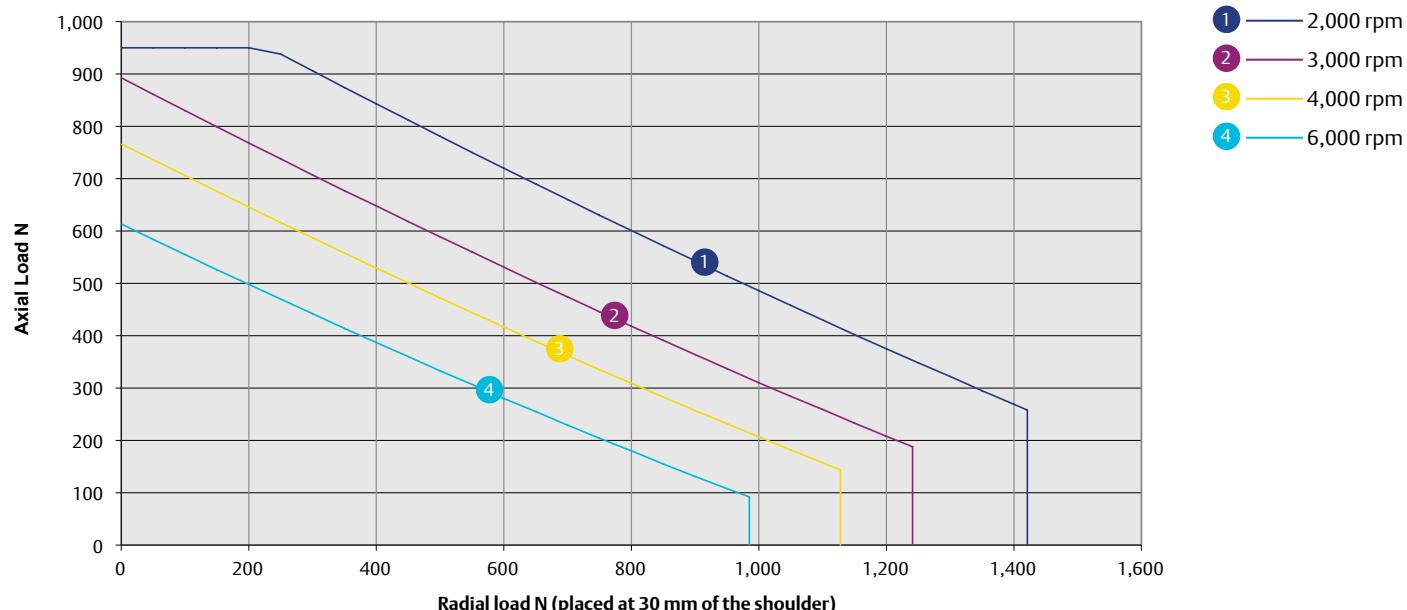

Radial load vs. axial load on 115U3/E3

115U3/E3 L_{10(h)} Bearing life for 20,000 hours (reliability 90 %, load factor of 1). Do not exceed a maximum axial load of 950 N

Axial loads exceeding that shown on the graph are permissible but the bearing life will be reduced below 20,000 hrs if applied

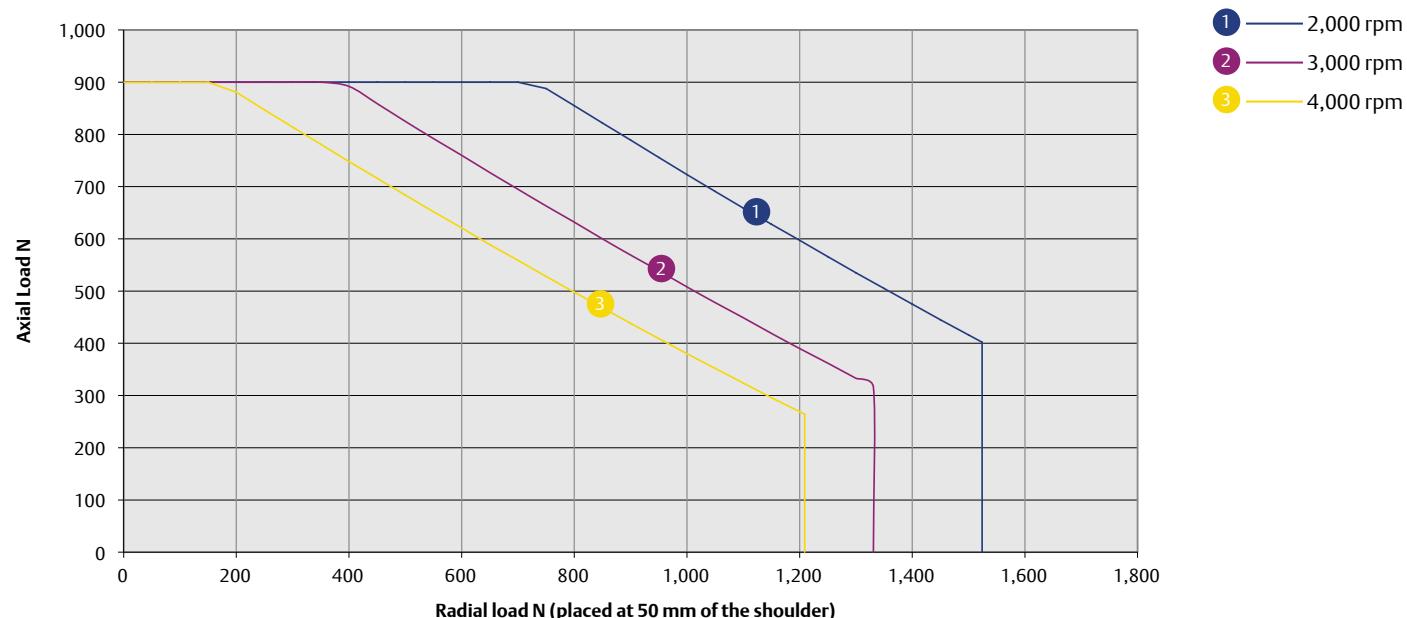

Radial load vs. axial load on 142U3/E3

142U3/E3 $L_{10(h)}$ Bearing life for 20,000 hours (reliability 90 %, load factor of 1). Do not exceed a maximum axial load of 950 N

Axial loads exceeding that shown on the graph are permissible but the bearing life will be reduced below 20,000 hrs if applied

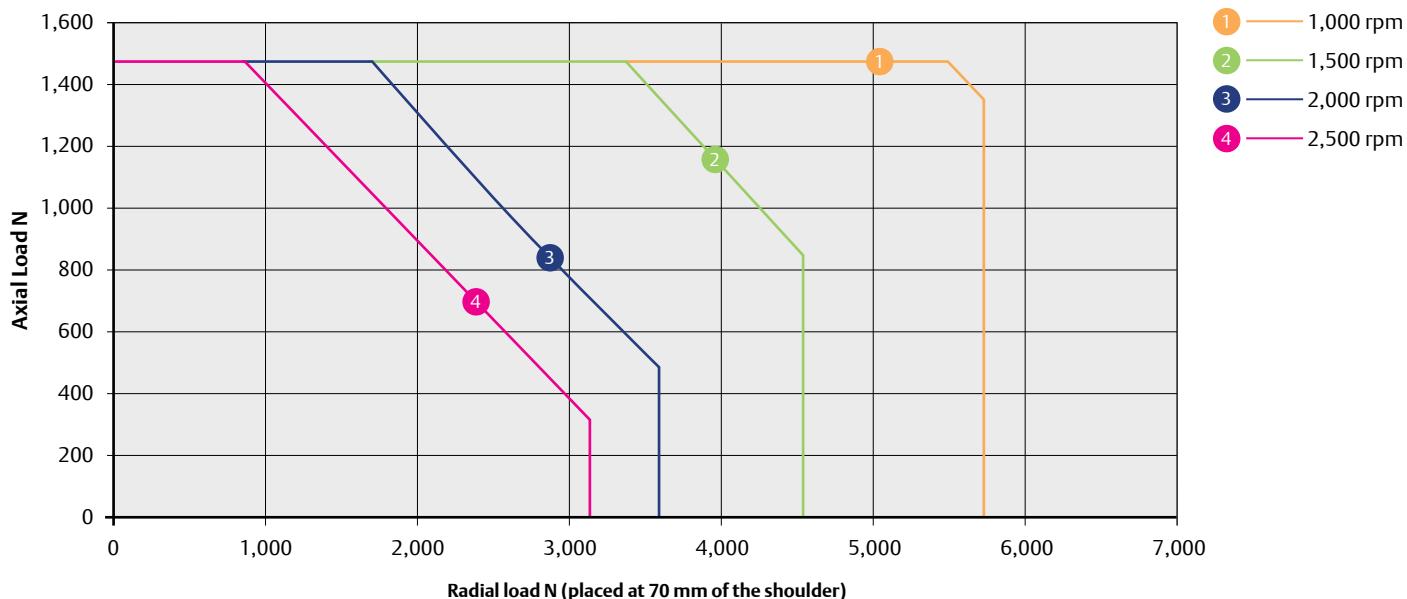

Radial load vs. axial load on 190U3/E3

190U3/E3 $L_{10(h)}$ Bearing life for 20,000 hours (reliability 90 %, load factor of 1). Do not exceed a maximum axial load of 900 N

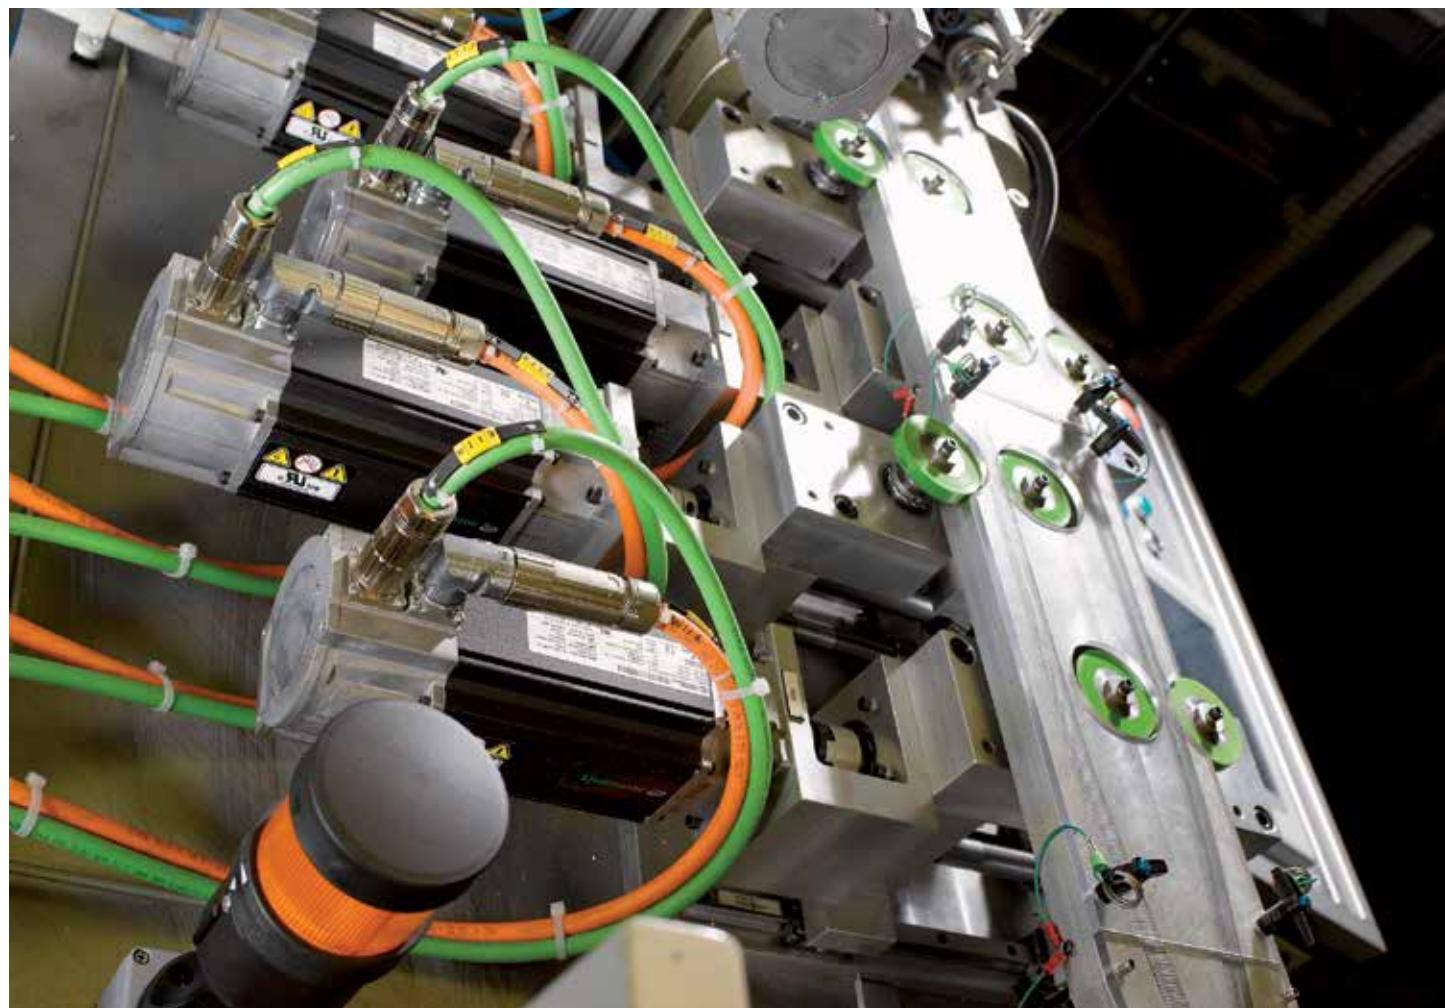

Axial loads exceeding that shown on the graph are permissible but the bearing life will be reduced below 20,000 hrs if applied

Radial load vs. axial load on 250U3

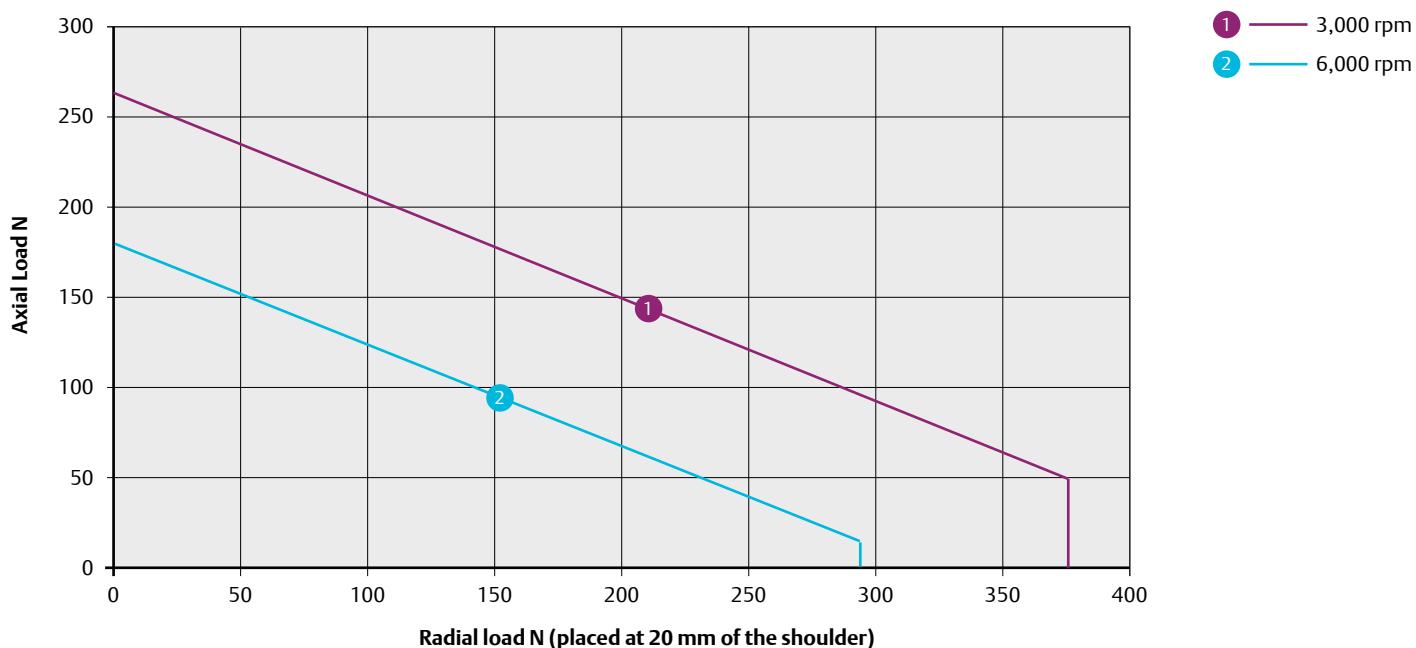

250U3 L_{10(h)} Bearing life for 20,000 hours (reliability 90 %, load factor of 1). Do not exceed a maximum axial load of 1,450 N

Axial loads exceeding that shown on the graph are permissible but the bearing life will be reduced below 20,000 hrs if applied

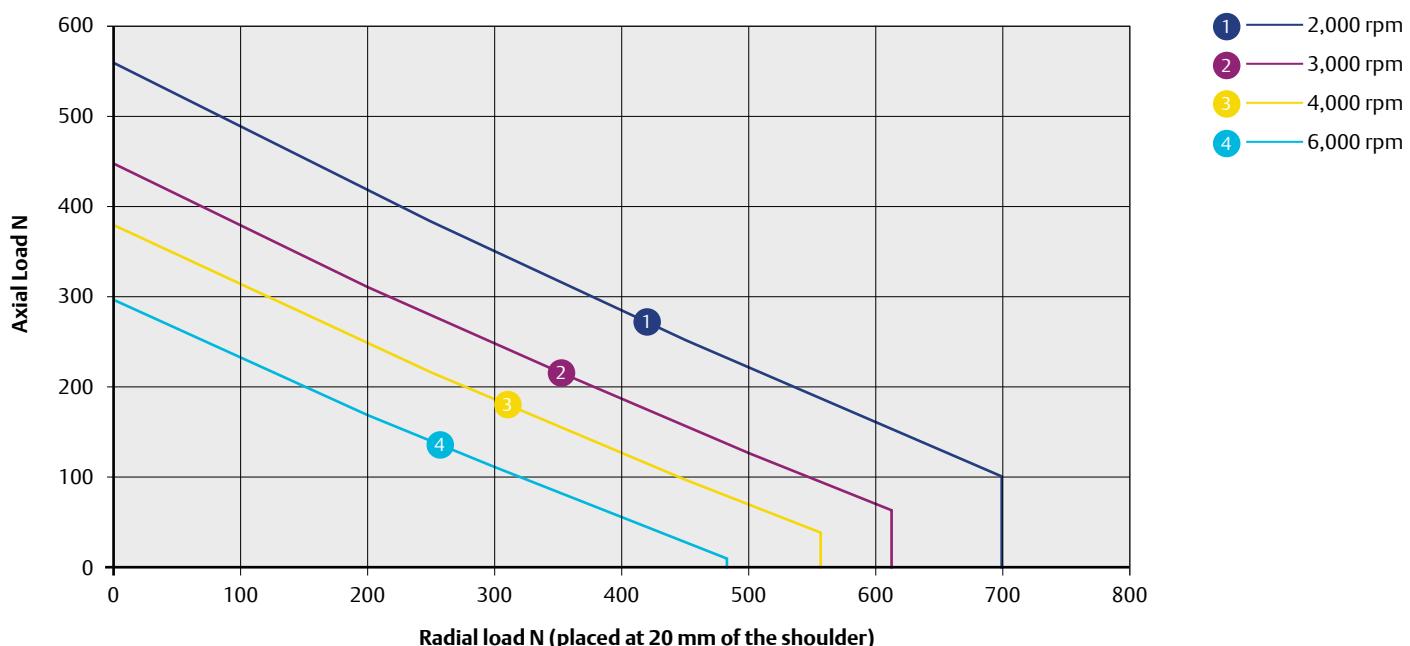

3.13.2 Unimotor hd

Radial load vs. axial load on 055UD/ED

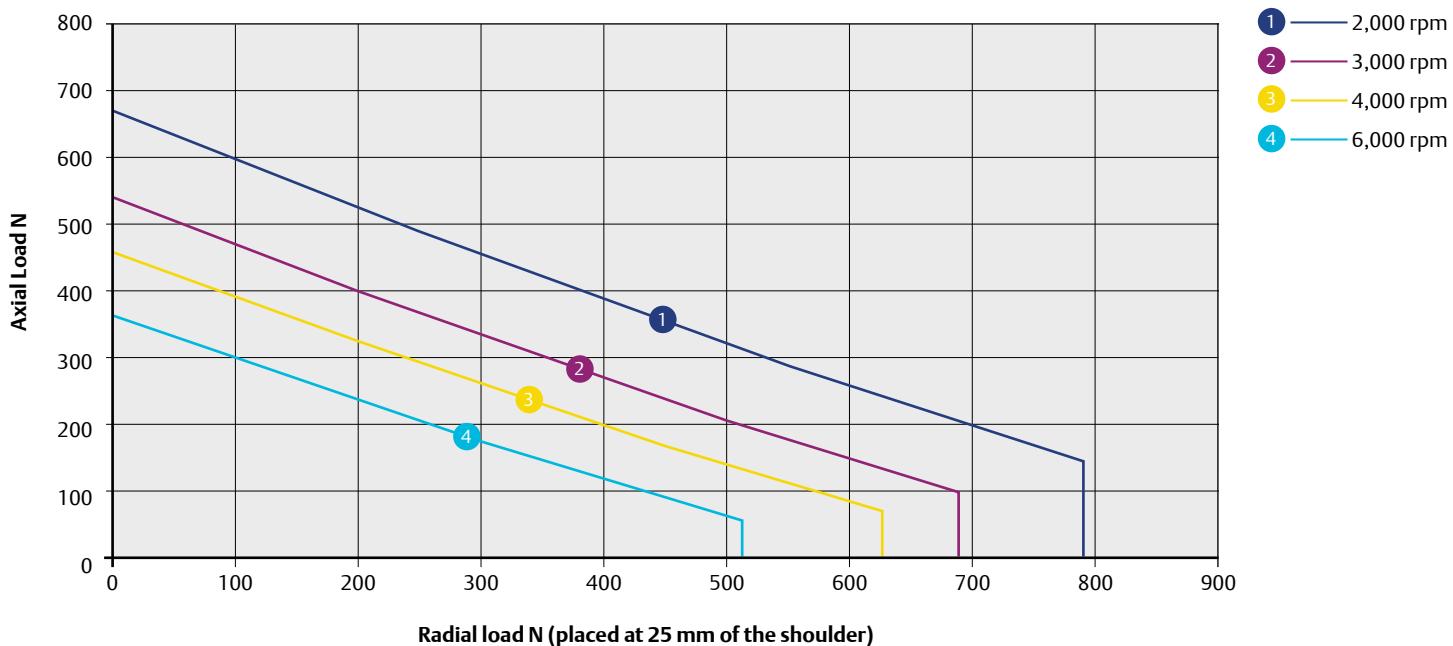

055UD/ED $L_{10(h)}$ Bearing life for 20,000 hours (reliability 90 %, load factor of 1). Do not exceed a maximum axial load of 650 N
Axial loads exceeding that shown on the graph are permissible but the bearing life will be reduced below 20,000 hrs if applied

Radial load vs. axial load on 067UD/ED

067UD/ED $L_{10(h)}$ Bearing life for 20,000 hours (reliability 90 %, load factor of 1). Do not exceed a maximum axial load of 650 N
Axial loads exceeding that shown on the graph are permissible but the bearing life will be reduced below 20,000 hrs if applied

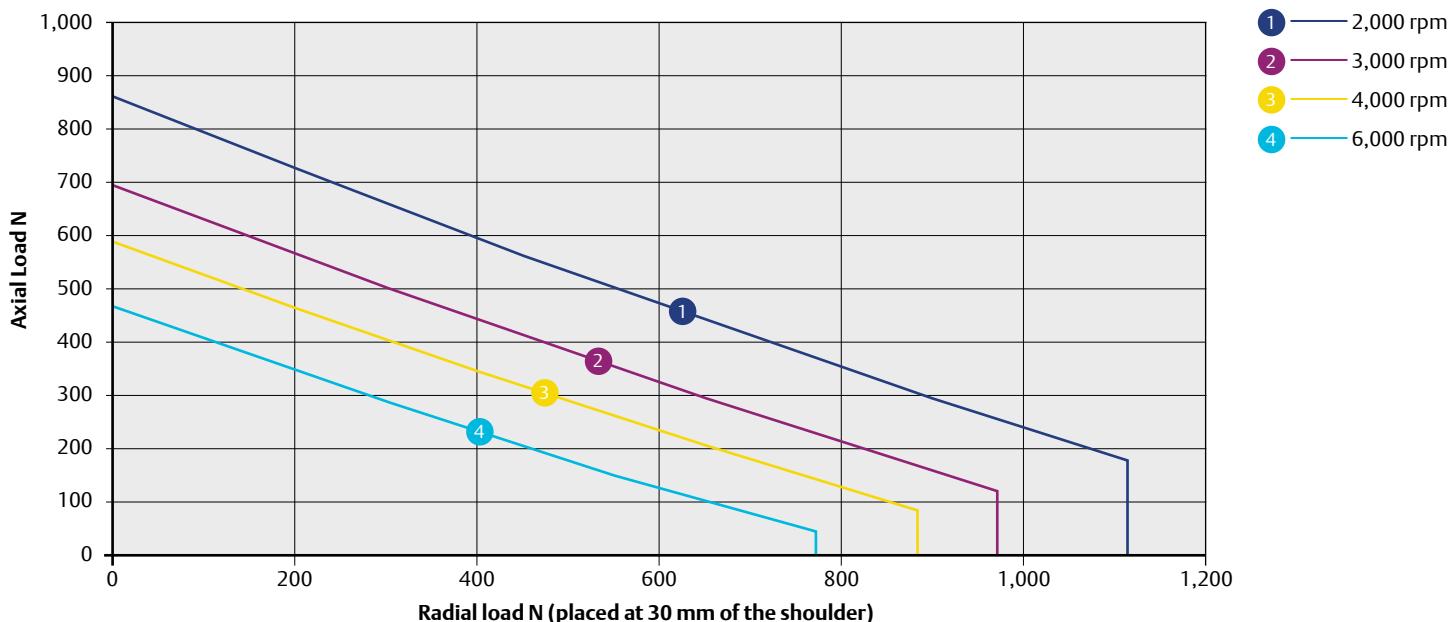

Radial load vs. axial load on 089UD/ED

089UD/ED $L_{10(h)}$ Bearing life for 20,000 hours (reliability 90 %, load factor of 1). Do not exceed a maximum axial load of 1,000 N

Axial loads exceeding that shown on the graph are permissible but the bearing life will be reduced below 20,000 hrs if applied

Radial load vs. axial load on 115UD/ED

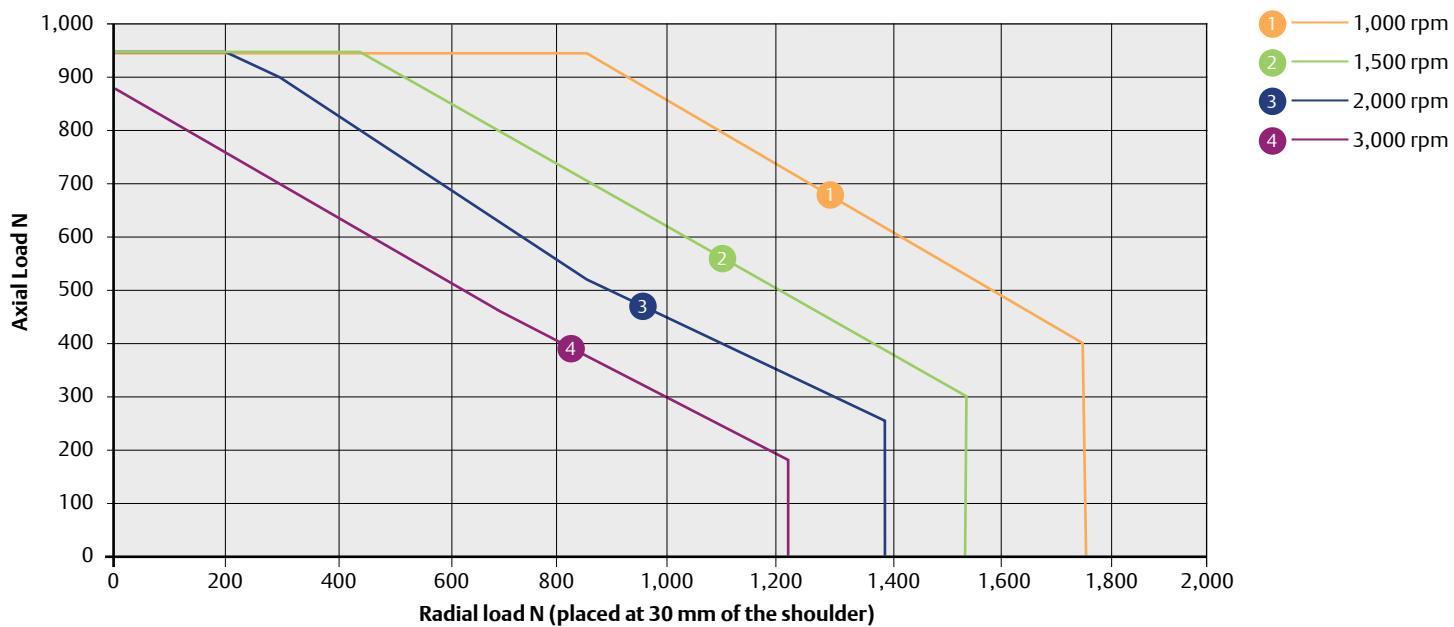

115UD/ED $L_{10(h)}$ Bearing life for 20,000 hours (reliability 90 %, load factor of 1). Do not exceed a maximum axial load of 1,200 N

Axial loads exceeding that shown on the graph are permissible but the bearing life will be reduced below 20,000 hrs if applied

It can be seen on some graphs that the curve line becomes horizontal.

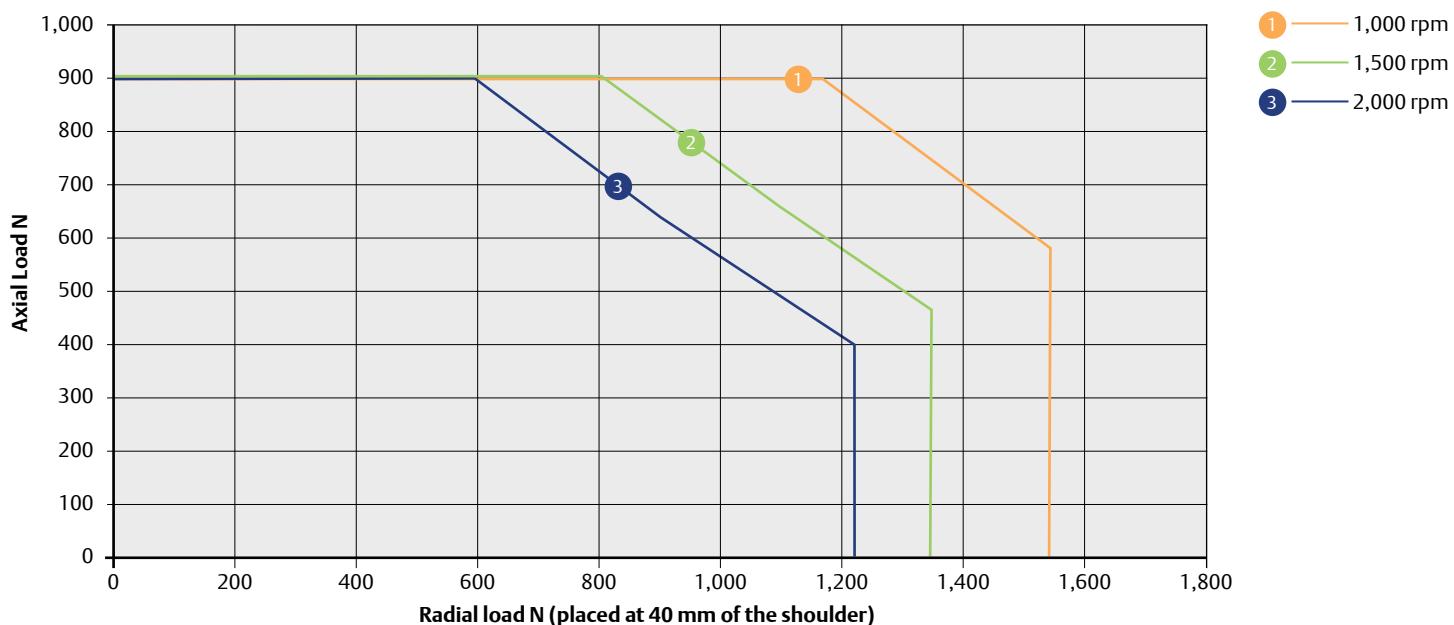

This is due to the axial pushing load on the shaft (see *Shaft push back load*). This limit should not be exceeded in case the shaft moves.

Radial load vs. axial load on 142UD/ED

142UD/ED $L_{10(h)}$ Bearing life for 20,000 hours (reliability 90 %, load factor of 1). Do not exceed a maximum axial load of 950 N
Axial loads exceeding that shown on the graph are permissible but the bearing life will be reduced below 20,000 hrs if applied

Radial load vs. axial load on 190UD/ED

190UD/ED $L_{10(h)}$ Bearing life for 20,000 hours (reliability 90 %, load factor of 1). Do not exceed a maximum axial load of 900 N
Axial loads exceeding that shown on the graph are permissible but the bearing life will be reduced below 20,000 hrs if applied

3.14 Bearing life and output shaft strength

The maximum output shaft that can be machined on the motor is determined by the inner diameter of the bearings. The bearing sizes on Unimotor fm motors have increased in comparison with the Unimotor UMs and this allows a larger output shaft to be machined. Larger output shafts mean stronger output shafts.

The following graphs show this improvement.

Maximum Bearing life

Please note: the graphs are based on theoretical calculations and the motor is affected by the following.

- Speed
- Radial load applied to the bearings
- Axial load applied to the bearings
- Shock and vibration
(external shock/vibration applied to the motor)
- Bearing temperature
- Bearing cleanliness
- Motor mounting to the application

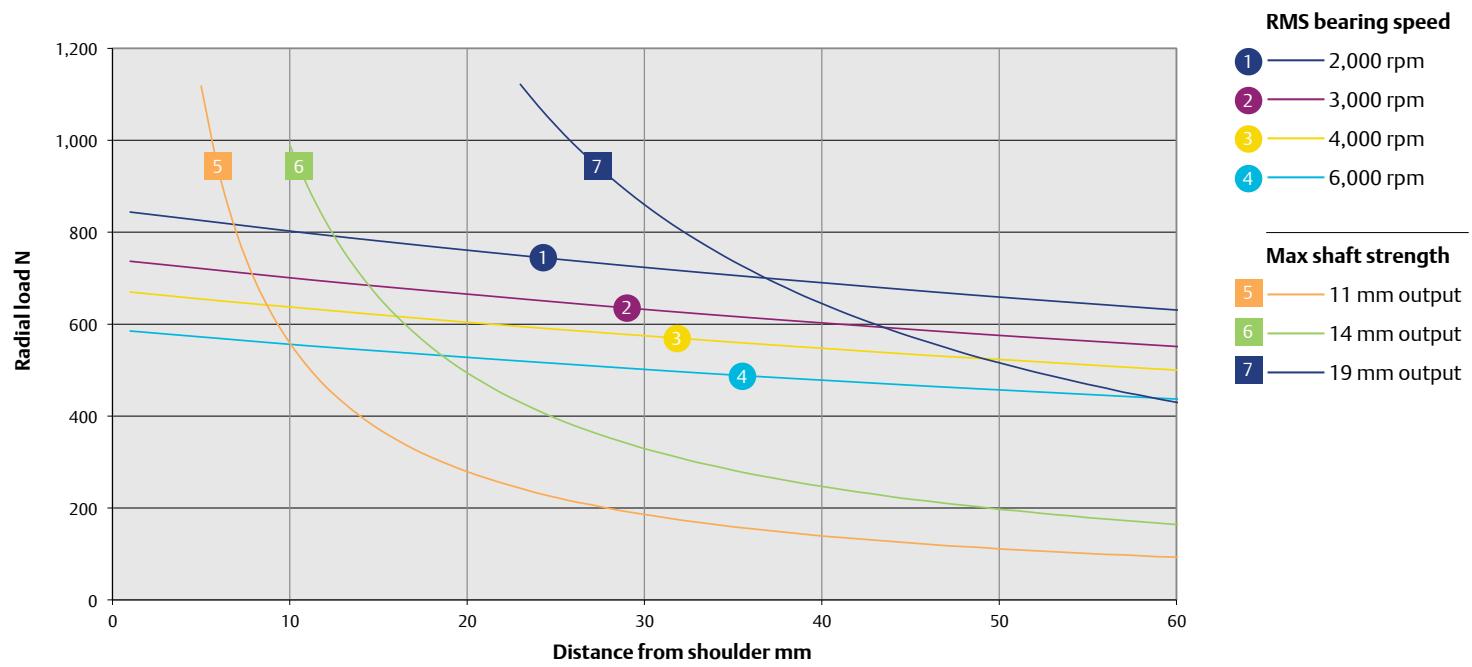

The loads in the following graphs have been theoretically calculated. The following factors were taken into consideration:

- 90 % reliability (for bearing life only)
- Radial load applied on the output shaft away from the shoulder and constant. The distance can be read on the different graphs.
- Axial loads going towards the motor and constant (Axial load = 0 Nm)
- Load factor of 1 - no vibration applied to the motor (for bearing life only).
- Temperature of the bearing: 100 °C max.
- Grease clean (for bearing life only).
- Torque alternating (for shaft strength only).

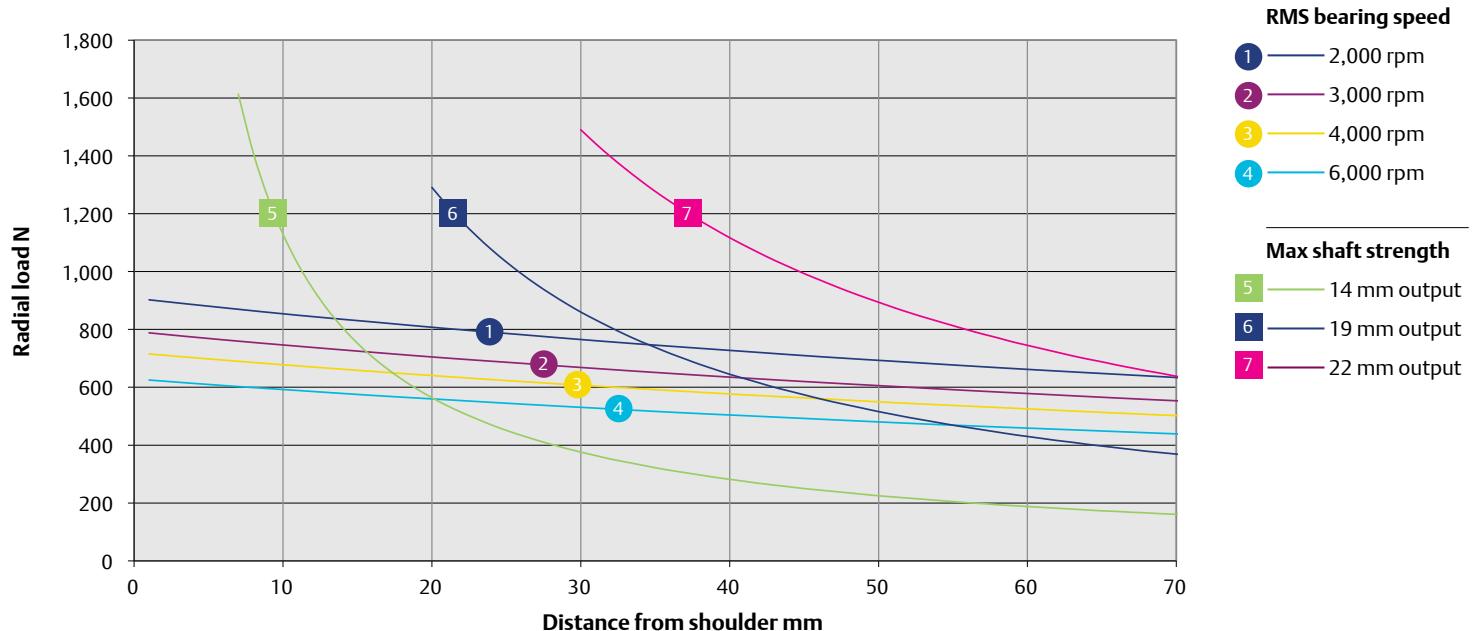

3.14.1 Unimotor fm

Bearing life and output shaft strength on 75U3/E3

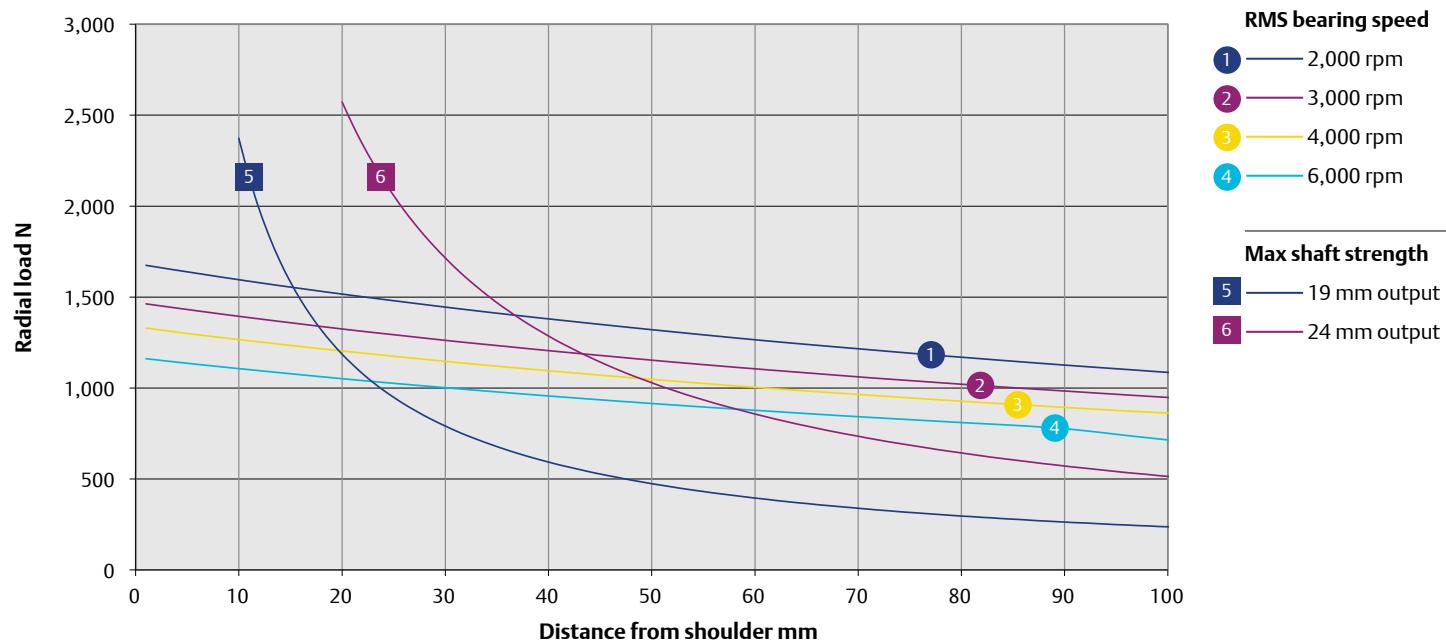

75U3/E3 $L_{10(h)}$ Bearing life and output shaft strength (20,000 hours, 90% reliability, load factor of 1)

Bearing life and output shaft strength on 95U3/E3

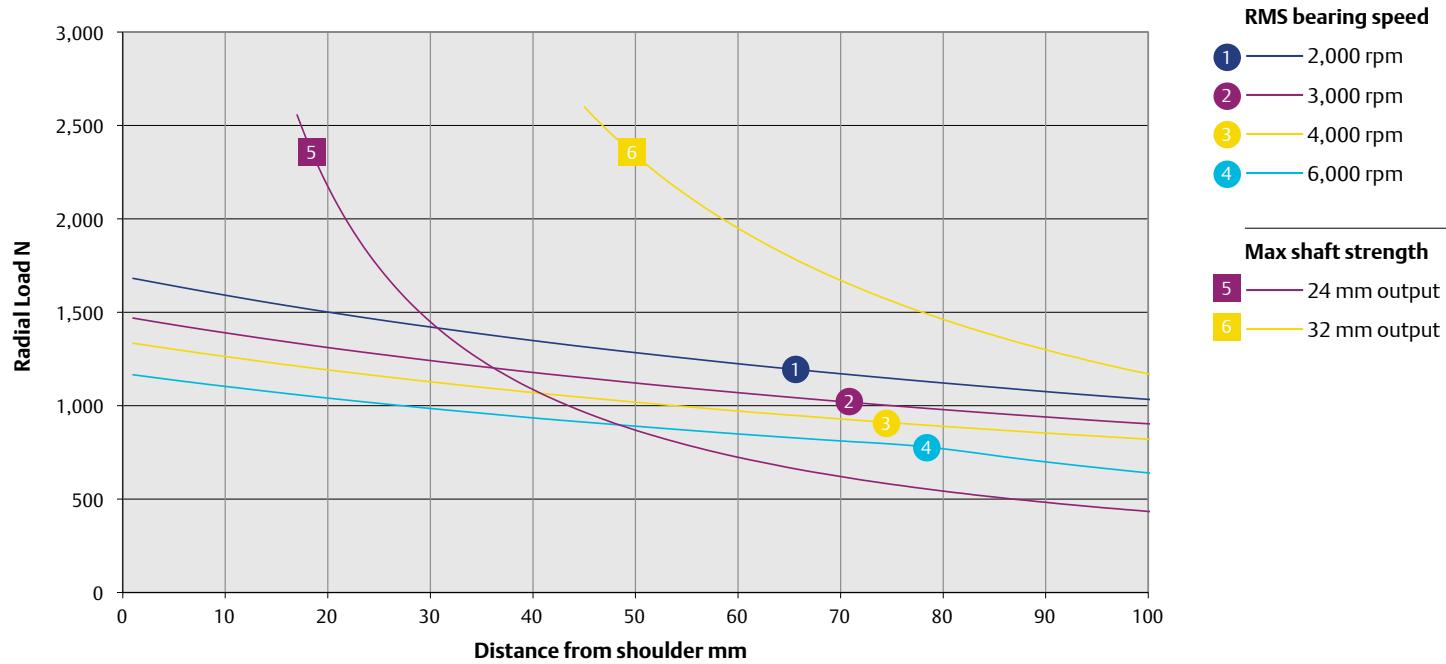

95U3/E3 $L_{10(h)}$ Bearing life and output shaft strength (20,000 hours, 90% reliability, load factor of 1)

Bearing life and output shaft strength on 115U3/E3

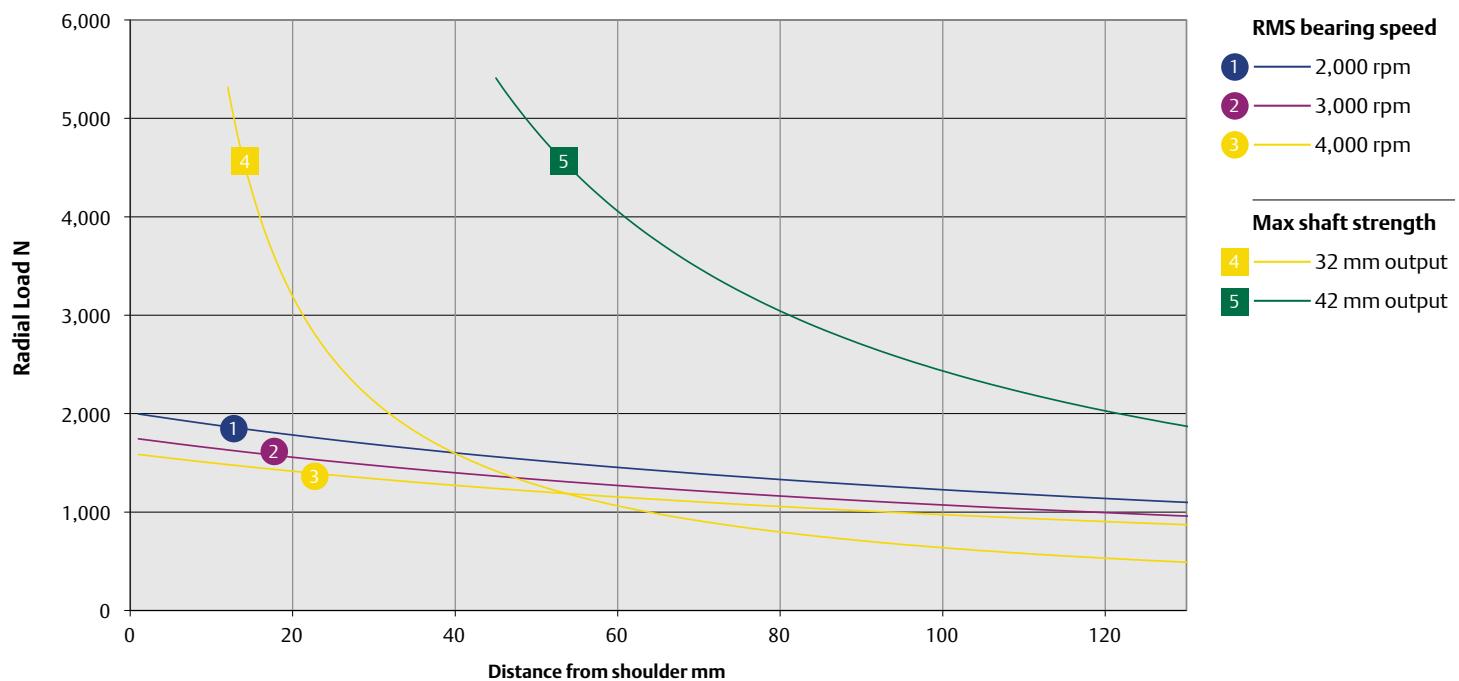

115U3/E3 $L_{10(h)}$ Bearing life and output shaft strength (20,000 hours, 90% reliability, load factor of 1)

Bearing life and output shaft strength on 142U3/E3

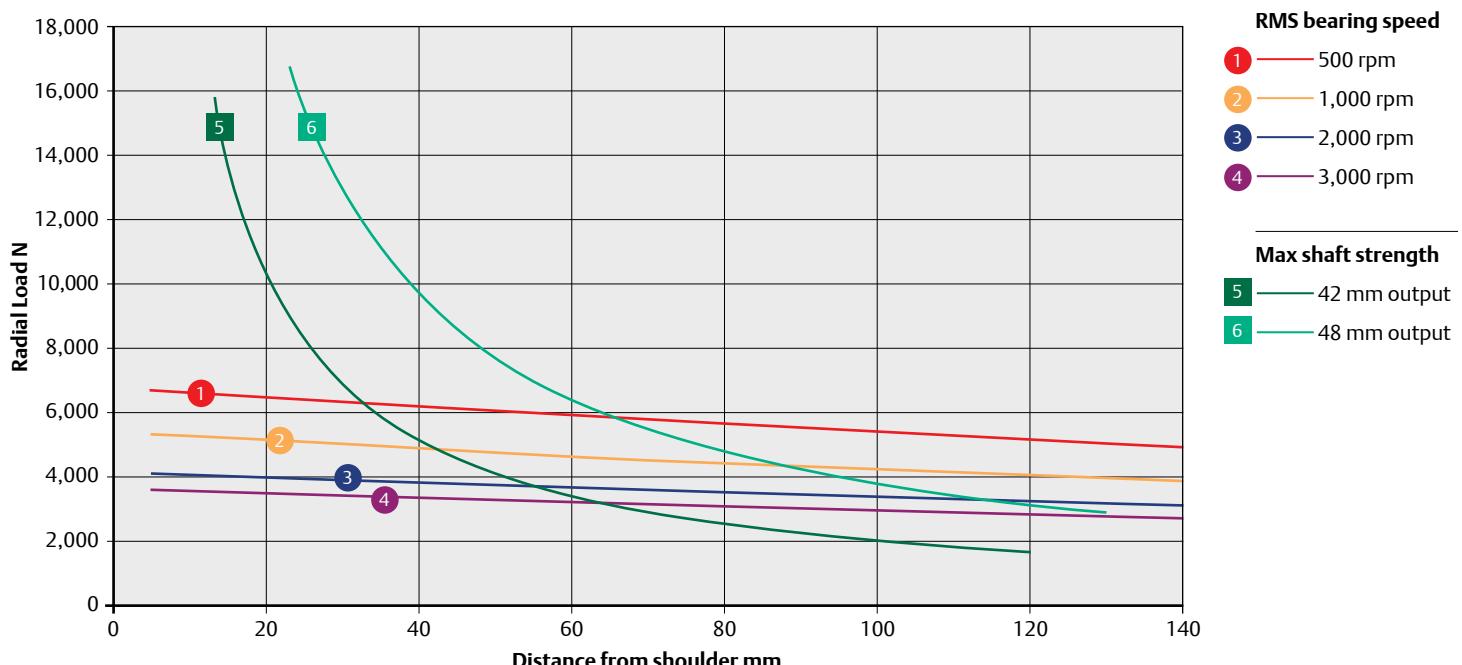

142U3/E3 $L_{10(h)}$ Bearing life for 20,000 hours (reliability 90 %, load factor of 1)

Bearing life and output shaft strength on 190U3/E3

190U3/E3 $L_{10(h)}$ Bearing life for 20,000 hours (reliability 90 %, load factor of 1)

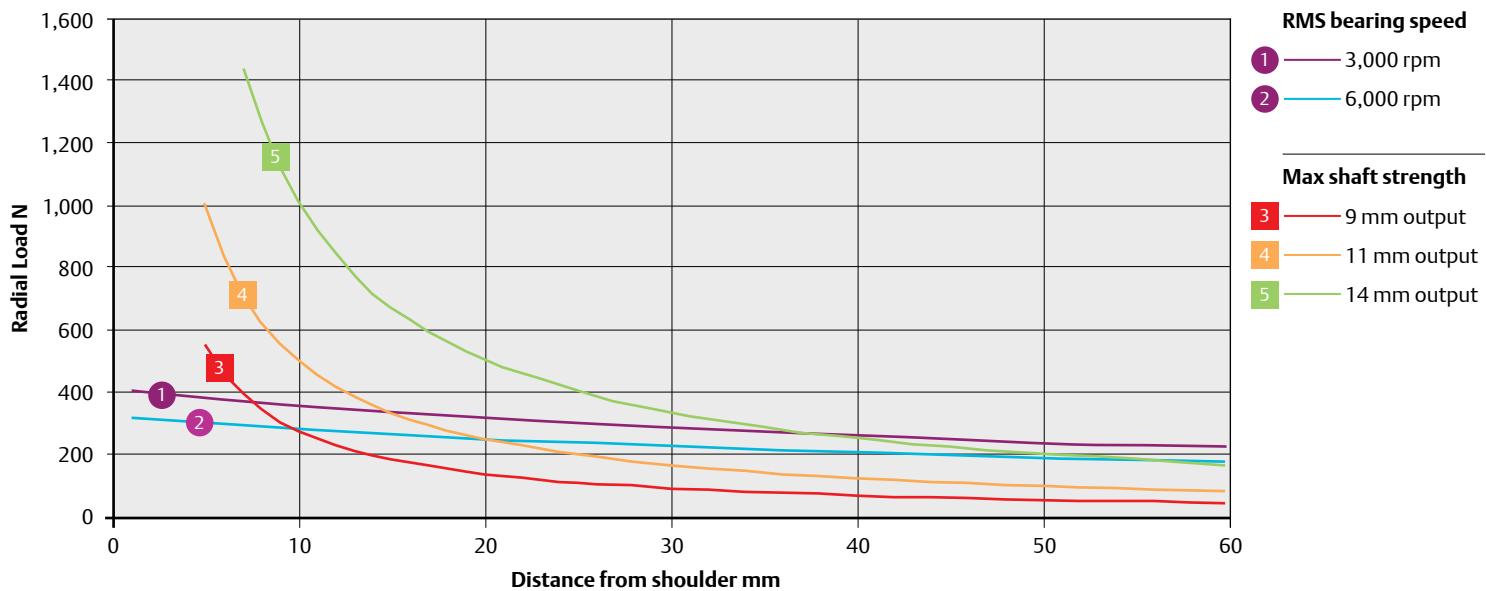

Bearing life and output shaft strength on 250U3/E3

250U3/E3 $L_{10(h)}$ Bearing life for 20,000 hours (reliability 90 %, load factor of 1)

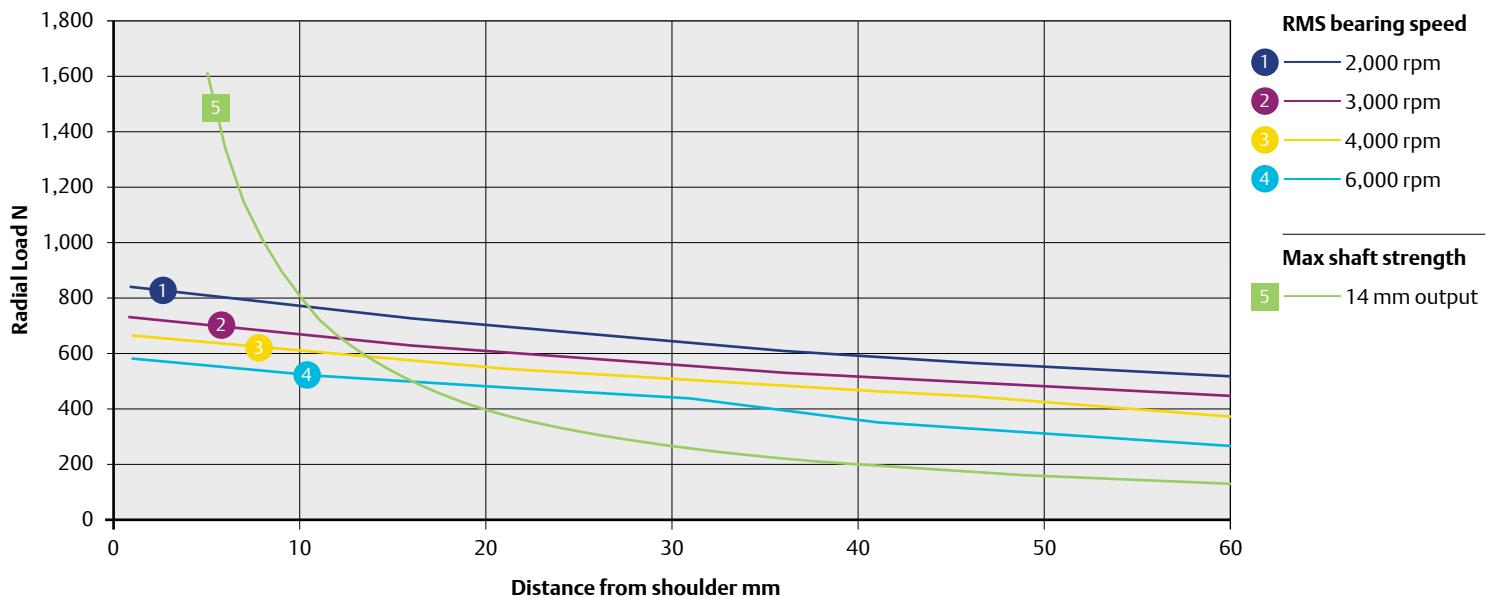

3.14.2 Unimotor hd

Bearing life and output shaft strength on 055UD/ED

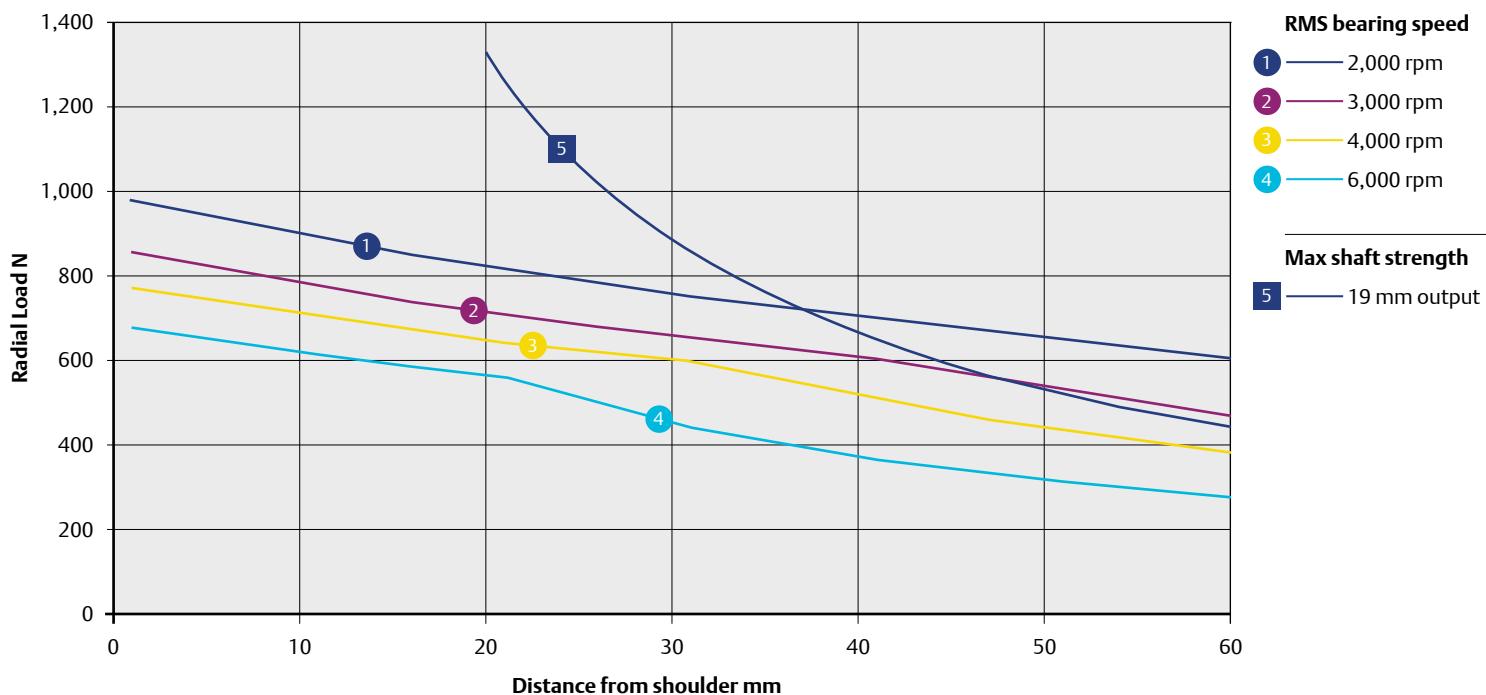

055UD/ED $L_{10(h)}$ Bearing life for 20,000 hours (reliability 90 %, load factor of 1). Do not exceed a maximum axial load of 450 N

Bearing life and output shaft strength on 067UD/ED

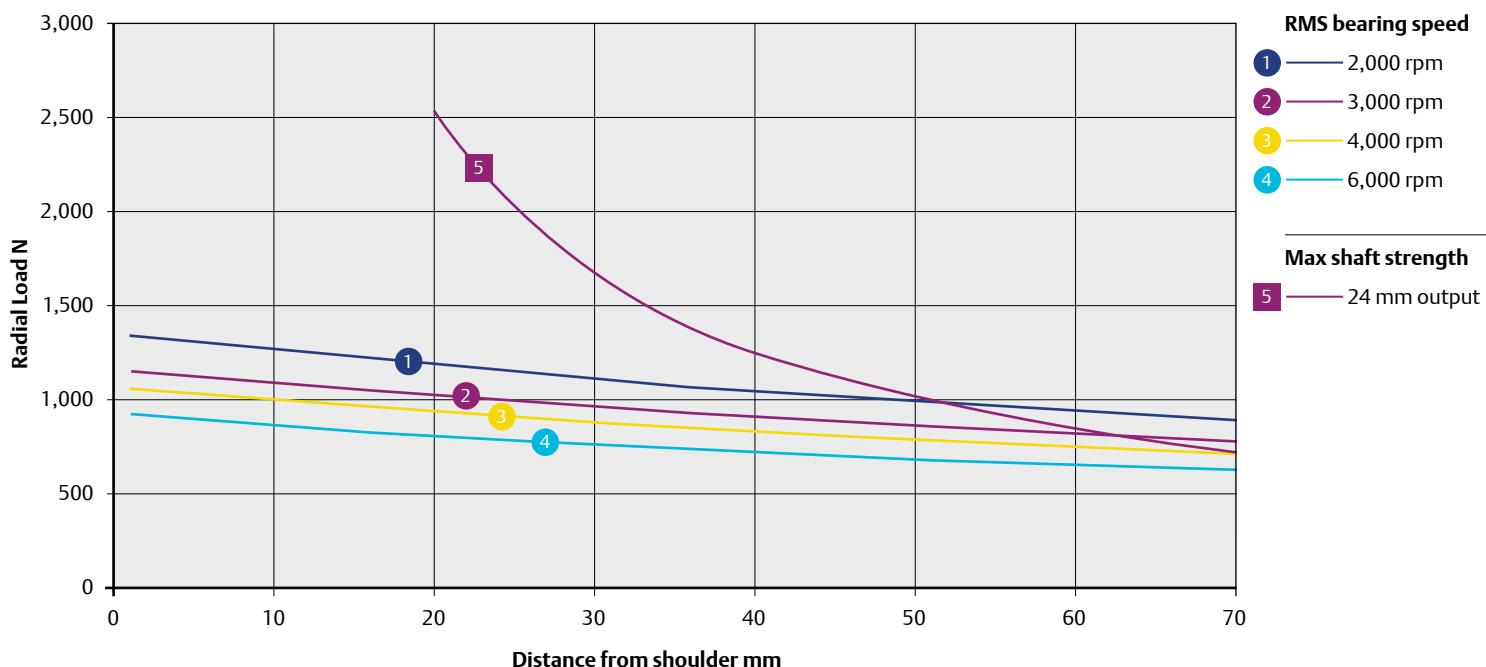

067UD/ED $L_{10(h)}$ Bearing life for 20,000 hours (reliability 90 %, load factor of 1).

Bearing life and output shaft strength on 089UD/ED

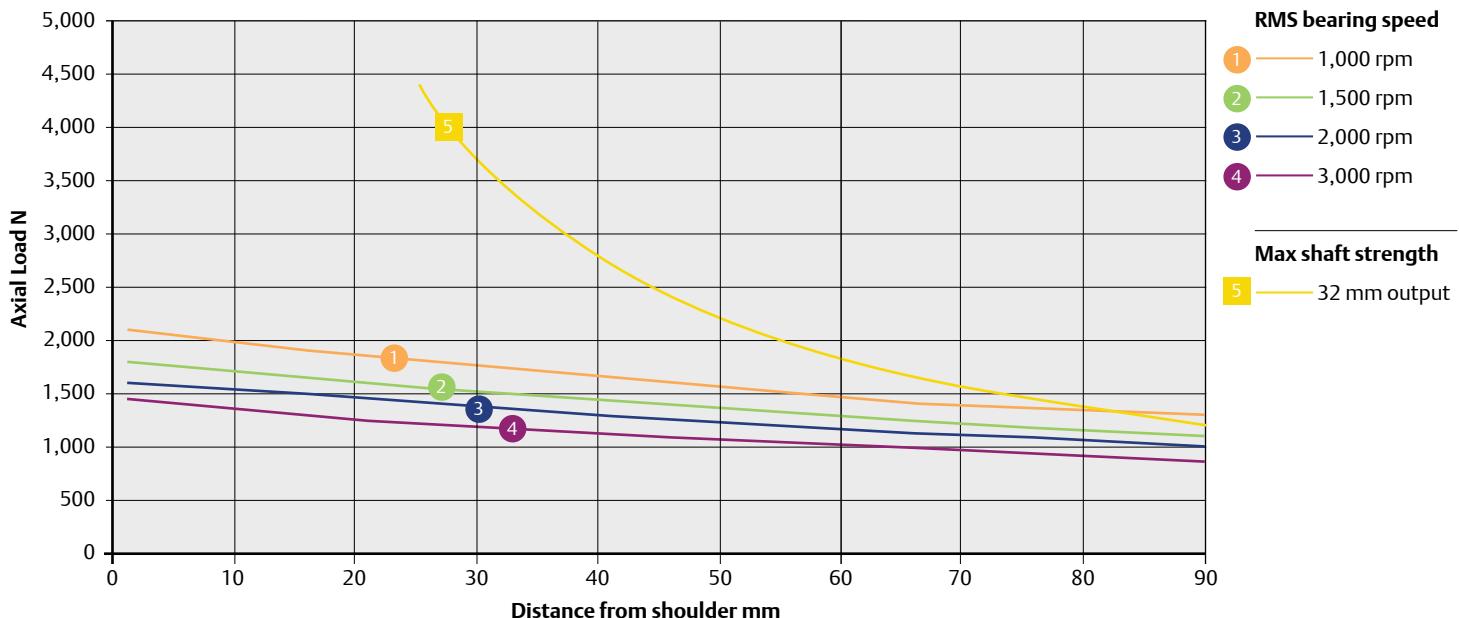

089UD/ED $L_{10(h)}$ Bearing life for 20,000 hours (reliability 90 %, load factor of 1).

Bearing life and output shaft strength on 115UD/ED

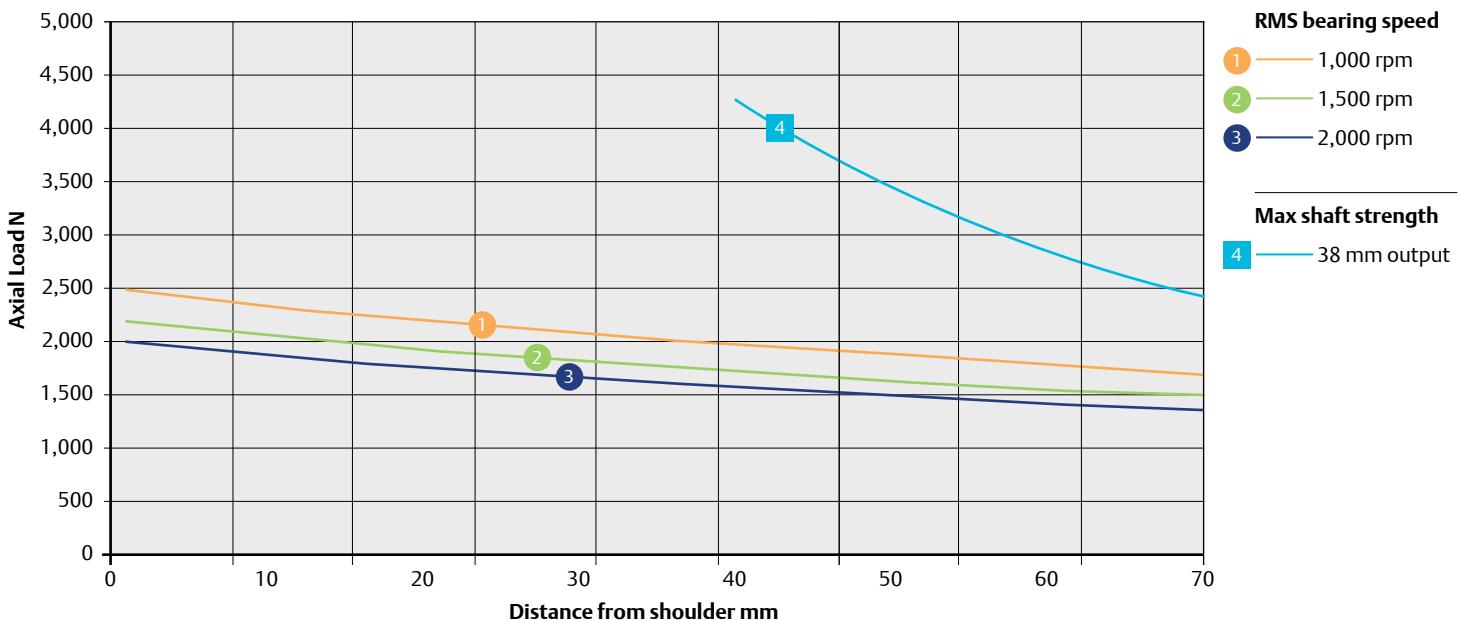

115UD/ED $L_{10(h)}$ bearing life for 20,000 hours (reliability 90 %, load factor of 1).

Bearing life and output shaft strength on 142UD/ED

142UD/ED $L_{10(h)}$ Bearing life for 20,000 hours (reliability 90 %, load factor of 1).

Bearing life and output shaft strength on 190UD/ED

190UD/ED $L_{10(h)}$ Bearing life for 20,000 hours (reliability 90 %, load factor of 1).

Shaft push back load

The minimum pushing load needed to move the rotor relative to the bearings.

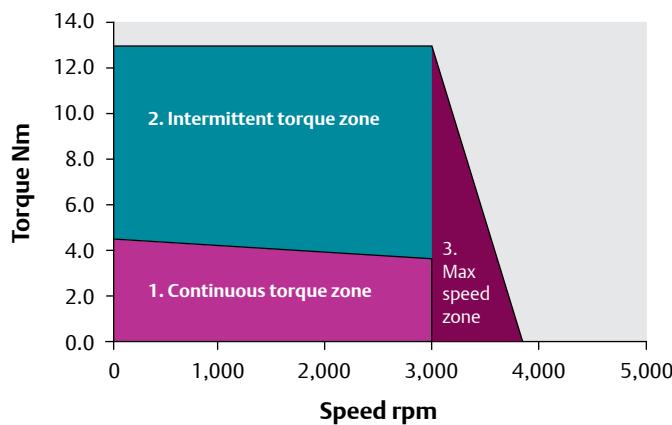

The table (right) shows the minimum push back force on Unimotor.

Motor	Push back force (N)	Motor	Push back force (N)
		Unimotor fm	Unimotor hd
075	900	055	190
095	850	067	650
115	950	089	1,000
142	950	115	1,200
190	900	142	1,350
250	1,450	190	1,600

4 Performance graphs

The torque speed graph depicts the limits of operation for a given motor. The limits of operation are shown for three categories.

Torque/speed graph

1. Continuous or rms torque zone

This area gives the effective continuous or rms torque available for repetitive torque sequences. Continuous or rms torque must be within this area otherwise the motor may overheat and cause the system to trip out.

2. Intermittent or peak torque zone

Above the continuous zone is the intermittent zone where the motor may be safely operated for short periods of time. Operation within the intermittent zone is permissible provided that the defined peak torque limit is not exceeded. On some frame sizes the peak torque factor of 3 x stall current only applies up to a certain percentage level of rms current before it starts to reduce.

Please refer to the *Standard (2) peak torque* section for details.

Maximum peak torque is the upper limit of the intermittent zone and must never be exceeded, to do so will damage the motor.

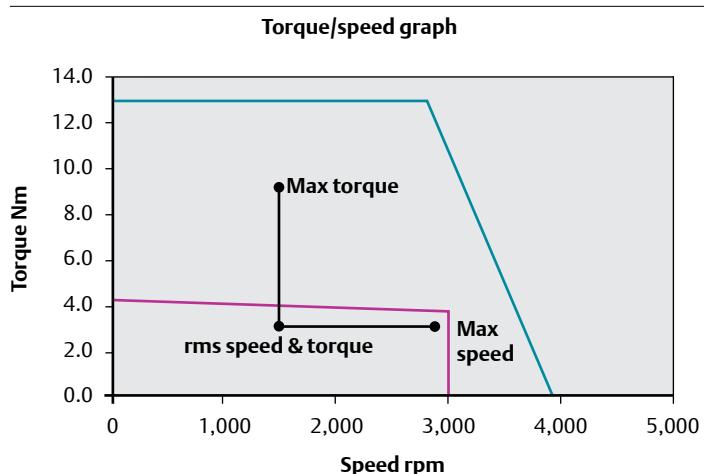

3. Maximum speed zone

To the right of the graph is a sloping line depicting the maximum motor speed when using a 200 V/400 V drive supply. The speed limit line is dependent upon the motor windings, and the voltage supplied to the drive. Operation within the maximum speed zone is permissible as long as the maximum speed limit is not exceeded. If the speed is increased beyond the limit shown, the motors sinusoidal waveform would have insufficient voltage and will clip and distort, causing inefficiency and higher temperature. If the distortion increases further, the drive may lose control of the motor and trip.

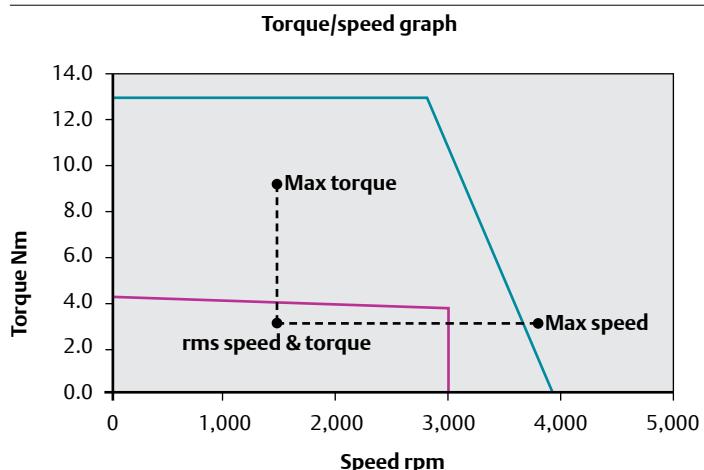

Plotting an operating point

To estimate whether a motor is the correct choice for a given system, it is necessary to calculate or measure the rms torque and the rms speed for a given system in its normal continual stop/start sequenced mode. These operating points may be plotted on the torque speed graph. As shown in the first graph below, if the rms

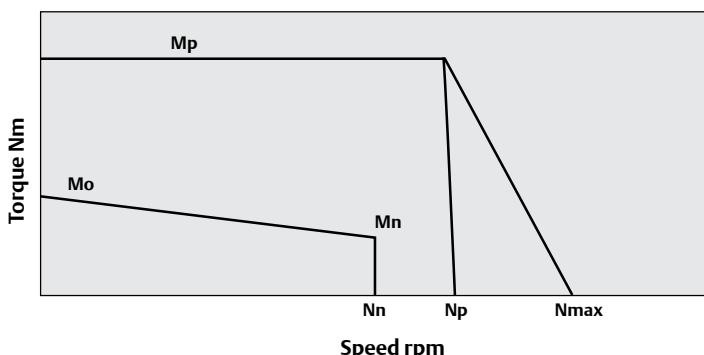

speed and torque point lies well within the continuous zone, then the motor is suitable for the application. The second graph below shows the max speed has increased to 3,900 rpm and this is now outside the safe area and another speed motor must be selected.

Max torque = 10 Nm: Max speed = 2,900 rms torque = 3 Nm: rms speed = 1,500

Max torque = 10 Nm: Max speed = 3,900 rms torque = 3 Nm: rms speed = 1,500

Mn = continuous torque at the rated speed: Nn = rated speed:
Np = maximum speed at the peak torque: Mo = stall torque:
Mp = peak torque: Nmax = maximum speed with no torque

Case Study 2 - Servo drives increase throughput of shrink wrapping machines

MIMI is one of Italy's leading manufacturers of shrink-wrapping machines.

The Challenge

When MIMI was developing its new MITO shrink-wrapping machine, the company turned to Control Techniques and Leroy-Somer to provide a servo solution. The MITO machine is designed for wrapping different configurations and pack sizes of bottles, cartons, cans and tubs, and its key selling point is its flexibility. MITO needed a drive that could be quickly and easily set up for different bundles and pack sizes, with different configurations and even different products.

The Solution

MIMI chose Digitax ST for its MITO machines. The drives were incorporated into three critical areas of the machines – speed of throughput, the cutting of the wrapping film and control of the wrapping action. Each Digitax ST is equipped with an SM-Applications module that provides onboard PLC functionality. Control Techniques' expert automation engineers worked closely with MIMI to help develop MITO and to ensure that the chosen automation solution met their needs.

The Benefits

- Increased machine throughput
- Onboard PLC functionality
- Easy reconfiguring of motors

5 Unidrive M700 and Digitax ST servo drives for continuous and pulse duty applications

5.1 Unidrive M700 – continuous duty

0.7 Nm – 136 Nm (408 Nm peak)

Unidrive M700 is an AC and servo drive optimized for continuous duty. Unidrive M700 offers class leading servo and induction motor performance with onboard real-time Ethernet. The drive provides high performance motor control to satisfy the requirements of machine builders and high performance industrial applications.

5.1.1 Benefits

Maximize throughput with superior motor control

- High bandwidth motor control algorithm for closed-loop induction, permanent magnet and servo motors - 3,000 Hz current loop bandwidth and 250 Hz speed loop bandwidth
- Flexible speed and position feedback interface supports a wide range of feedback technologies from robust resolvers to high resolution encoders
 - Up to three encoder channels simultaneously e.g. 1 feedback encoder, 1 reference encoder and 1 simulated output
 - Quadrature, SinCos (including absolute), SSI, EnDat (up to 4 Mb with EnDat 2.2 and 100 m of cable as line compensation is supported) and resolvers
 - Simulated encoder output can provide position reference for CAMs, digital lock and electronic gearbox applications

Optimize system performance with onboard Advanced Motion Controller

- M700 incorporates an Advanced Motion Controller capable of controlling 1.5 axis. The motion functions are carried out 'on the drive' so that system performance is maximized.

Design flexible centralized and decentralized control systems

- Onboard PLC for logic programs
- MCi modules can be added to execute larger programs for advanced system control capability
- Machine Control Studio is an industry standard IEC61131-3 programming environment for efficient system design and configuration
- Integrated dual port Ethernet switch provides simple connectivity using standard connections
- Onboard real-time Ethernet (IEEE 1588 V2) uses RTMoE (Real Time Motion over Ethernet) to provide fast communication and accurate axis synchronization
- Three System Integration ports are available to fit additional fieldbus, position feedback and I/O options

Flexible machine design with options modules

Unidrive M700 can be tailored for a wide variety of demanding servo and induction applications. The drive has three option slots for System Integration modules, giving maximum flexibility

- Machine control: MCi200, MCi210, SI-Applications Plus
- Communications: SI-Ethernet, SI-PROFINET RT, SI-EtherCAT, SI-CANopen, SI-PFIBUS, SI-DeviceNet
- Safety: SI-Safety
- Additional I/O: SI-I/O
- Feedback: SI-Encoder, SI-Universal Encoder
- 15 way D-type converter
- Single ended encoder interface (15 V or 24 V)

Conform to safety standards, maximize uptime and reduce costs by integrating directly with safety systems

- M700 has an integrated STO input and can accommodate an SI-Safety module for safe motion functions

Auxiliary power system flexibility

- Unidrive M can run with a wider operating DC voltage input, from 24 V up to maximum rated Volts providing optimum choice of auxiliary power supply for back-up purposes

5.1.2 Unidrive M700 variants: M701 and M702

Unidrive M701

Unidrive M701 has 2 x RS485 ports onboard instead of Ethernet. Parameter sets can be ported to Unidrive M using a smartcard or Unidrive M connect. Unidrive M701 is a direct upgrade for Unidrive SP users.

Unidrive M702 – Enhanced Safety

Unidrive M702 has an additional STO input for applications that require onboard Ethernet and dual STO to comply with SIL 3 PLe.

5.2 Servo drives: Digitax ST – pulse duty

From 0.72 Nm to 18.8 Nm (56.4 Nm Peak)

Digitax ST is a dedicated servo drive optimized for pulse duty.
The drive is designed to help meet the demands of modern manufacturers for smaller, more flexible and higher performing machinery.

5.2.1 Benefits

Maximize throughput with superior motor control

- High bandwidth motor control algorithm for servo motors
- Optimum performance for high-dynamic applications with 300 % overload
- Supports a wide range of feedback technologies from robust resolvers to high resolution encoders
 - Up to two encoder channels simultaneously e.g. 1 feedback encoder and 1 simulated output
 - Quadrature, SinCos, SSI, EnDat, Hiperface
 - Robust resolvers (SM resolver module required)
 - Simulated encoder output can provide position reference for CAMs, digital

Reduce cabinet size with compact drive design

- Digitax ST is compact and can be flush mounted which at high current ratings can save up to 50 % of cabinet space compared to competitor products
- Onboard features such as Safe Torque Off reduce the need for external components

Flexible machine design with option modules

Digitax drives can be tailored for a variety of applications. Two option slots allow increasing capabilities.

- Communication options: to support Ethernet or popular fieldbuses such as Ethernet/IP, PROFIBUS-DP and CANopen
- Feedback options: to support resolvers, or to increase the number of encoder inputs/outputs
- Input and output options: for additional on-board digital, analog or high-speed I/O
- Application modules: second processor for specific applications such as register control (see page 11 for a full list of available option modules)

Reduced development time

- Three motion programming options:
 - CTSoft index motion
 - SyPTPro
 - PowerTools Pro
- Fieldbus option modules are independently certified for conformity with open standards
- 2D and 3D CAD files to make it easier and quicker to design the drive into your machine

Quicker installation

- The top or bottom of the drive can be located onto a DIN rail
- Features grounding brackets and cable management support for easy mounting
- Pluggable control terminals enable looms to be easily prepared

Reduced commissioning time

- Digitax ST can be quickly configured using the removable keypad, Smartcard or supplied commissioning software
- Autotune gets the best performance by measuring machine dynamics and automatically optimizing control loop gains
- CTScope – a realtime software oscilloscope – is supplied for tuning and monitoring
- Motor data can be retrieved automatically from the electronic nameplate on the digital encoder

Auxiliary power system flexibility

- Digitax ST can run with a wider operating DC voltage input, from 48 V up to maximum rated Volts providing optimum choice of auxiliary power supply for back-up purposes

5.2.2 Digitax ST is available in five variants:

- EtherCAT - Built in EtherCAT connectivity
- Plus - With on board APC motion controller
- EZ Motion - Easy-to-use motion programming
- Indexer - Point-to-point positioning functionality
- Base - Digital or analog control

5.3 Drive and motor combinations

Case Study 3 - Unidrive M brings throughput and efficiency improvements to fastening presses

Penn Engineering, a global leader in fastening solutions, is using Unidrive M in servo-driven presses to insert fasteners primarily for the European and North American markets.

The Challenge

Penn needed to change its existing systems from air over oil to electric. This would result in a number of positive benefits, including the elimination of oil leak issues which were crucial in specific markets. The new system would also need to deliver greater flexibility, increased cycle rates and RoHS compliance.

The solution

Working with Control Techniques, a highly customized system was commissioned utilizing Unidrive M700 and M701 drives which control one linear device. The motors enable and disable on the fly to hand off from one motor to the other, with seamless motion, to control the same linear device.

The Benefits

- Increased efficiency and throughput
- RoHS compliance
- Significant cost savings

Case Study 4 - Servo motors and drives at the heart of printing, converting and finishing machines from Rotary Logic Systems

Rotary Logic Systems creates bespoke systems for various high speed printing applications.

The challenge

Rotary Logic Systems supplies both stand-alone machines and modules to suit all applications in the converting and finishing industries. The company needed a servo solution for a six line, multi-stage anti-counterfeit machine for packaging, incorporating high precision application of a hot-foil hologram. Alan Chandler, the company's director, says: "We need drives that are flexible in operation, straight forward to program and with very fast response- that's why we use mainly Digitax ST Plus servo-drives from Control Techniques".

The solution

The lines each comprise unwind and in-feed, foiling, flying head die-cutting, flexographic printing, out-feed and rewind. Digitax ST Plus servo drives twinned with Unimotor fm servo motors control the feeds and various other processes.

The Benefits

- Flexible operation
- Straightforward programming
- Very fast response

6 Motor and signal cables

Cables are an important part of a servo system installation. Not only must the noise immunity and integrity of the cabling and connectors be correct, but also SAFETY and EMC regulations must be complied with to ensure successful, reliable and fail safe operation. One of the most frequent problems experienced by motion systems engineers is incorrect connections of the motor to the drive.

Ready made cables from Control Techniques and Leroy-Somer allow system installers to avoid the intricate, time consuming assembly normally associated with connecting servo systems. Installation and set-up time are greatly reduced - there is no fiddling with wire connections and crimp tools, and no fault finding.

The cables are made to order in lengths from 1m to 100 m.

Power cable variants

- Phase conductors 1.0 mm² (10 A) to 25 mm² (70 A)
- With and without brake wire pairs
- Motor end connector
- Motor end ferrules for hybrid box
- Drive end is tailored to suit the drive and can have ferrules or ring terminals

Cable features

- PUR outer sheath for oil resistance and dynamic performance. The PUR jacket has excellent abrasion, chemical and ozone resistance along with low smoke and low halogen flame retardant construction suitable for internal and external industrial environments.
- PVC outer sheath for oil resistance and static performance.
- Complies with DESINA coding - Orange for power, Green for signal
- Power cable and plugs UL recognized
- Optimum noise immunity
- Encoder cable has low volt drop for long cable lengths and separately screened thermistor wires.
- No need for crimp and insertion / removal tools
- Production build gives quality and price benefits
- Power cables with and without brake wires
- Cable assembly type identification label
- Brake wires are separately shielded within the power cable

6.1 General Cable Specifications

	POWER		SIGNAL			
	PVC	PUR	PUR	PVC		
Electrical	<ul style="list-style-type: none"> → Nominal voltage : 1,000 V UL Power cores Uo/U 0,6/1 kV Control cores Uo/U 300/500 V → Test voltage : 3 kV → Conductor resistance (at 20 °C) : according to class 6 VDE 0295, EN 60228 → Insulation resistance (at 20 °C) : > 20 MΩ x km 		<ul style="list-style-type: none"> → Nominal voltage : 1,000 V UL Maximum 350 V (VDE/DIN) → Test voltage : maximum 3 kV → Conductor resistance (at 20 °C) : according to class 6 VDE 0295, EN 60228 → Insulation resistance (at 20 °C) : > 20 MΩ x km → Mutual capacitance : core/core approx. 70 pF/m core/screen approx. 110 pF/m → Speed of propagation (Vp) : 5,05 ns/m (66 %) 			
Mechanical	<ul style="list-style-type: none"> → Minimum bending radius : 15 x outer diameter (fixed installation) 	<ul style="list-style-type: none"> → Minimum bending radius : 5 x outer diameter (fixed installation) → Minimum bending radius : 7.5 x outer diameter (dynamic installation) → Installation : cable into drag-chain → Maximum speed : 300 m/min → Maximum acceleration : 40 m/s² → Drag-chain length : maximum 15 m → Number of cycle : 5,000,000 		<ul style="list-style-type: none"> → Minimum bending radius : 15 x outer diameter (fixed installation)
